

INTRODUCTION TO ASPEN PLUS SIMULATION

What is Process Simulation/Analysis?

The purpose of process simulation is to model and predict the performance of a process. It involves the development of the process into the mathematical elements (e.g. units) and subsequent study of performance. The process identification is e.g. flowsheet, instrumentation, composition, process operation, equipment sizes, etc. It can predict the energy analysis, balances (flow, enthalpy, etc.) and material balances, material requirements and integrator requirements (e.g. ASPEN Plus). In addition, process analysis may involve the use of mathematical tools to predict and evaluate performance. Examples of process simulation, not yet given, are process design and diagnosis and are described under process design (Fig. 1). The tool used here is ASPEN Plus. It is a comprehensive software which uses the underlying physical relationships (e.g., material and energy balances, thermodynamic properties, etc.) to predict process performance (e.g., stream properties, operating conditions, and equipment sizes).

Fig. 1. Process Simulation Problem.

There are several advantages of computer-aided simulation:

- Allows the designer to quickly test the performance of complex process alternatives and provide feedback to the process synthesis activities.
- Can be incorporated with process synthesis to finding optimum integrated designs.
- Minimizes experimental and scale-up efforts.
- Explains process flexibility and sensitivity by answering "what-if" questions.
- Quantitatively models the process and checks design/operating performance.

Despite the many advantages, before venturing into the exciting world of computer-aided simulation:

- You must carefully read the original ASPEN documentation.
- The documentation will generally not give an easy step-by-step guide to simulation.
- Not all ASPEN simulation products that the chemical industry makes physical sense. Otherwise you will find that the software becomes one of the "black-box" products.
