1. Introduction

Zinc oxide (ZnO) nanomaterials have emerged as one of the most promising materials for electronic devices such as solar cells, light-emitting diodes, transistors, and sensors. The diverse structure of ZnO nanomaterials produce unique, useful, and novel characteristics that are applicable for high-performance devices. The ZnO nanorod array is a structural structure that has become extremely important in many applications due to its porous, large surface area, high electron mobility, and variety of tunable properties. The chemistry and physical nature of its surface state, including processes such as adsorption and chemical reactions, enhance its functionality and sensitivity and consequently improve the device performance. These novel characteristics of ZnO nanorod array enable the fabrication of ultraviolet (UV) photoconductive sensors with high sensitivity and reliability. Although there are many techniques available to synthesize the ZnO nanorod array, solution-based methods offer many advantages, including the capacity for low-temperature processing, large-scale deposition, low cost, and excellent ZnO crystalline properties. In this chapter, the synthesis of ZnO nanorod array via the ultrasonic-assisted sol-gel and immersion methods will be discussed for application to UV photoconductive sensors. The optical, structural, and electrical properties of deposited ZnO nanorod array will be reviewed, and the performance of the ultraviolet ZnO nanorod array-based UV photoconductive sensor will be discussed.

2. Ultraviolet photoconductive sensor using ZnO nanomaterials

Recently, ZnO nanostructures have received much attention due to their promising characteristics for electronic, optical, and photonic devices. Generally, ZnO exhibits semiconducting properties with a wide band gap of 3.3 eV at room temperature and a strong binding energy of 80 meV, which is much larger than that of gallium nitride (GaN), 26
