Human Factors Models for Aviation Accident Analysis and Prevention Thomas G.C. Griffin, Mark S. Young, Neville A. Stanton, 2017-03-02 The investigation and modelling of aviation accident causation is dominated by linear models. Aviation is however a complex system and as such suffers from being artificially manipulated into non-complex models and methods. This book addresses this issue by developing a new approach to investigating aviation accident causation through information networks. These networks centralise communication and the flow of information as key indicators of a system's health and risk. This holistic approach focuses on the system environment, the activity that takes place within it, the strategies used to conduct this activity, the way in which the constituent parts of the system both human and non-human interact, and the behaviour required. Each stage of this book identifies and expands upon the potential of the information network approach, maintaining firm focus on the overall health of a system. The book's new model offers many potential developments and some key areas are studied in this research. Through the centralisation of barriers and information nodes, the method can be applied to almost any situation. The application of Bayesian mathematics to historical data populations provides scope for studying error migration and barrier manipulation. The book also provides application of these predictions to a flight simulator study for the purposes of validation. Beyond this, it also discusses the applicability of the approach to industry. Through working with a legacy airline, the methods discussed are used as the basis for a new and prospective safety management system.

Encyclopedia of Parallel Computing David Padua, 2011-09-08 Containing over 300 entries in an A-Z format, the Encyclopedia of Parallel Computing provides easy, intuitive access to relevant information for professionals and researchers seeking access to any aspect within the broad field of parallel computing. Topics for this comprehensive reference were selected, written, and peer-reviewed by an international pool of distinguished researchers in the field. The Encyclopedia is broad in scope, covering machine organization, programming languages, algorithms, and applications. Within each area, concepts, designs, and specific implementations are presented. The highly structured essays in this work comprise synonyms, a definition, and discussion of the topic, bibliographies, and links to related literature. Extensive cross-references to other entries within the Encyclopedia support efficient, user-friendly searches for immediate access to useful information. Key concepts presented in the Encyclopedia of Parallel Computing include laws and metrics, specific numerical and non-numerical algorithms, asynchronous algorithms, libraries of subroutines, benchmark suites, applications, sequential consistency, and cache coherency. Machine classes such as clusters, shared memory multiprocessors, special purpose machines, and dataflow machines, specific machines such as Cray supercomputers, IBM's cell processor, and Intel's multicore machines, race detection, and auto-parallelization, parallel programming languages, synchronization primitives, collective operations, message passing libraries, checkpointing, and operating systems. Topics covered: Speedup, Efficiency, Isoefficiency, Redundancy, Amdahl's
