Objective: We aimed to develop and validate a risk prediction model for liver cancer based on routinely available risk factors using the data from UK Biobank prospective cohort study.

Methods: This analysis included 359,489 participants (2,894,807 person-years) without a previous diagnosis of cancer. We used the Fine-Gray regression model to predict the incident risk of liver cancer, accounting for the competing risk of all-cause death. Model discrimination and calibration were validated internally. Decision curve analysis was conducted to quantify the clinical utility of the model. Nomogram was built based on regression coefficients.

Results: Good discrimination performance of the model was observed in both development and validation datasets, with an area under the curve (95% confidence interval) for 5-year risk of 0.782 (0.748–0.816) and 0.771 (0.702–0.840) respectively. The calibration showed fine agreement between observed and predicted risks. The model yielded higher positive net benefits in the decision curve analysis than considering either all participants as being at high or low risk, which indicated good clinical utility.

Conclusion: A new risk prediction model for liver cancer composed of routinely available risk factors was developed. The model had good discrimination, calibration and clinical utility, which may help with the screening and management of liver cancer for general population in the public health field.

statistical concepts and regression methods can be applied in medical prediction problems including diagnostic and prognostic outcomes Many advances have been made in statistical approaches towards outcome prediction but a sensible strategy is needed for model development validation and updating such that prediction models can better support medical practice There is an increasing need for personalized evidence based medicine that uses an individualized approach to medical decision making In this Big Data era there is expanded access to large volumes of routinely collected data and an increased number of applications for prediction models such as targeted early detection of disease and individualized approaches to diagnostic testing and treatment Clinical Prediction Models presents a practical checklist that needs to be considered for development of a valid prediction model Steps include preliminary considerations such as dealing with missing values coding of predictors selection of main effects and interactions for a multivariable model estimation of model parameters with shrinkage methods and incorporation of external data evaluation of performance and usefulness internal validation and presentation formatting The text also addresses common issues that make prediction models suboptimal such as small sample sizes exaggerated claims and poor generalizability The text is primarily intended for clinical epidemiologists and biostatisticians Including many case studies and publicly available R code and data sets the book is also appropriate as a textbook for a graduate course on predictive modeling in diagnosis and prognosis While practical in nature the book also provides a philosophical perspective on data analysis in medicine that goes beyond predictive modeling Updates to this new and expanded edition include A discussion of Big Data and its implications for the design of prediction models Machine learning issues More simulations with missing y values Extended discussion on between cohort heterogeneity Description of ShinyApp Updated LASSO illustration New case studies [Risk Adjustment for Measuring Health Care Outcomes](#) Lisa I.
