Nonlinear Dynamics of Structures Under Extreme Transient Loads Adnan Ibrahimbegovic, Naida Ademović, 2019-05-21 The effect of combined extreme transient loadings on a structure is not well understood whether the source is man made such as an explosion and fire or natural such as an earthquake or extreme wind loading A critical assessment of current knowledge is timely with Fukushima like disasters or terrorist threats The central issue in all these problems is structural integrity along with their transient nature their unexpectedness and often the uncertainty behind their cause No single traditional scientific discipline provides complete answers rather a number of tools need to be brought together nonlinear dynamics probability theory some understanding of

the physical nature of the problem as well as modeling and computational techniques for representing inelastic behavior mechanisms Nonlinear Dynamics of Structures Under Extreme Transient Loads covers model building for different engineering structures and provides detailed presentations of extreme loading conditions A number of illustrations are given quantifying a plane crash or explosion induced impact loading the effects of strong earthquake motion and the impact and long duration effects of strong stormy winds along with a relevant framework for using modern computational tools The book considers the levels of reserve in existing structures and ways of reducing the negative impact of high risk situations by employing sounder design procedures
