Introduction Applied Geophysics Burger Vaelid:

Introduction to Applied Geophysics H. Robert Burger, Anne F. Sheehan, Craig H. Jones, 2023-10-12 *Introduction to Applied Geophysics* covers the fundamental methods of exploration geophysics in a depth and style both challenging and appropriate to undergraduates. Because of the increasing opportunities for students to conduct field experiments the authors focus on methods, examples, illustrations, applications, and problem sets that emphasize shallow exploration of the Earth's surface. The textbook includes chapters on refraction, seismology, electrical resistivity methods, gravity, magnetic surveying, and electromagnetic methods, including ground conductivity measurements and ground penetrating radar. Geologic engineering and environmental applications are emphasized throughout. For each geophysical method, the theory and its application in exploring a given target is introduced. Each chapter includes a brief discussion of the applicable instruments, field operations, data collection and reduction, and limitations on interpretation. The textbook is supported by an extensive package of software. This edition from Cambridge University Press is a re-issue of the W. W. Norton edition first published in 2006. [Introduction to Applied Geophysics](#) Henry Robert Burger, Anne F. Sheehan, Craig H. Jones, 2006. Offering a chapter on each of the most common methods of exploration, the text explains in detail how each method is performed and discusses that method's geologic engineering and environmental applications. In addition to ample examples, illustrations, and applications throughout, each chapter concludes with a problem set. The text is also accompanied by the Field Geophysics Software Suite, an innovative CD-ROM that allows students to experiment with refraction and reflection seismology, gravity, magnetics, electrical resistivity, and ground penetrating radar methods of exploration. The decision of the General Assembly of the International Union of Theoretical and Applied Mechanics to organize a Symposium on Dynamics of Slender Vortices was greeted with great enthusiasm. The acceptance of the proposal forwarded by the Deutsches Komitee für Mechanik (DEKOMECH) signaled that there was a need for discussing the topic chosen in the frame of the IUTAM Symposia offer. Also, the location of the symposium was suitably chosen. It was decided to hold the symposium at the RWTH Aachen, where years ago Theodore von Karman had worked on problems related to those to be discussed now anew. It was clear from the beginning of the planning that the symposium could only be held in the von Karman Auditorium of the Rheinisch-Westfälische Technische Hochschule Aachen, a building named after him. The symposium was jointly organized by the editors of this volume, strongly supported by the local organizing committee. The invitations of the scientific committee brought together scientists actively engaged in research on the dynamics of slender vortices. It was the aim of the committee to have the state of the art summarized and also to have the latest results of specific problems investigated communicated to the participants of the symposium. The topics chosen were asymptotic theories, numerical methods, vortices in shear layers, interaction of vortices, vortex breakdown, vortex sound, and aircraft and helicopter vortices.
