Computer Organization, Design, and Architecture Sajjan G. Shiva, 2025-05-30 This unique and classroom proven text provides a hands on introduction to the design of computer systems It depicts step by step the design and programming of a simple but complete hypothetical computer followed by detailed architectural features of existing computer systems as enhancements to the structure of the simple computer This treatment integrates the four categories of digital systems architecture logic design computer organization computer hardware and computer system

architecture This edition incorporates updates to reflect contemporary organizations and devices including graphics processing units GPUs quantum computing and the latest supercomputer systems It also includes a description of the two popular Instruction Set Architectures ARM and RISC V The book is suitable for a one or two semester undergraduate or beginning graduate course in computer science and computer engineering its previous editions have been adopted by 120 universities around the world The book covers the topics suggested by the recent IEEE ACM curriculum for computer architecture and organization

Computer Logic Design M. Morris Mano,1972 **Computer Assisted Conceptual Structural Design of Steel Buildings** Hiroyuki Fuyama,1993 **Elements of Parallel Computing** Eric Aubanel,2016-12-08

Designed for introductory parallel computing courses at the advanced undergraduate or beginning graduate level **Elements of Parallel Computing** presents the fundamental concepts of parallel computing not from the point of view of hardware but from a more abstract view of algorithmic and implementation patterns The aim is to facilitate the teaching of parallel programming by surveying some key algorithmic structures and programming models together with an abstract representation of the underlying hardware The presentation is friendly and informal The content of the book is language neutral using pseudocode that represents common programming language models The first five chapters present core concepts in parallel computing SIMD shared memory and distributed memory machine models are covered along with a brief discussion of what their execution models look like The book also discusses decomposition as a fundamental activity in parallel algorithmic design starting with a naive example and continuing with a discussion of some key algorithmic structures Important programming models are presented in depth as well as important concepts of performance analysis including work depth analysis of task graphs communication analysis of distributed memory algorithms key performance metrics and a discussion of barriers to obtaining good performance The second part of the book presents three case studies that reinforce the concepts of the earlier chapters One feature of these chapters is to contrast different solutions to the same problem using select problems that aren't discussed frequently in parallel computing textbooks They include the Single Source Shortest Path Problem the Eikonal equation and a classical computational geometry problem computation of the two dimensional convex hull After presenting the problem and sequential algorithms each chapter first discusses the sources of parallelism then surveys parallel algorithms
