

- *Exercise 2.2-4 from CLRS.* How can we modify almost any algorithm to have a good best-case running time?

- *Problem 4.1-6 from CLRS.*

Solve the recurrence  $T(n) = 2T(\sqrt{n}) + 1$  by making a change of variables. Your solution should be asymptotically tight. Do not worry about whether values are integral.

- *Solve problem 2.4 from DVP*

Suppose you are choosing between the following three algorithms.

1

- 
- **Algorithm A** solves problems by dividing them into five sub-problems of half the size, recursively solving each sub-problem, and then combining the solutions in linear time.
  - **Algorithm B** solves problems of size  $n$  by recursively solving two sub-problems of size  $n - 1$  and then combining the solutions in constant time.
  - **Algorithm C** solves problems of size  $n$  by dividing them into nine sub-problems of size  $n/3$ , recursively solving each sub-problem, and then combining the solutions in  $\mathcal{O}(n^2)$  time.

What are the running times of each of these algorithms (in big-O notation), and which would you choose.
