

Rudiments of radar

- Fundamentally, the radar consists of transmitter and a receiver
- It works by generating EM waves that is radiated into space by an antenna. A portion of the EM waves is intercepted by the TARGET and re-radiated. The re-radiated waves is collected by the radar receiver antenna and passed on to a receiver where it is processed and displayed.

Robotic Sailing Alexander Schlaefer,Ole Blaurock,2011-07-15 While sailing has a long tradition both as a means of transportation and as a sport robotic sailing is a fairly new area of research One of its unique characteristics is the use of wind for propulsion On the one hand this allows for long range and long term autonomy On the other hand the dependency on changing winds presents a serious challenge for short and long term planning collision avoidance and boat control Moreover building a robust and seaworthy sailing robot is no simple task leading to a truly interdisciplinary engineering problem These proceedings summarize the state of the art as presented at the International Robotic Sailing Conference 2011 Following an overview of the history of autonomous sailing a

number of recent boat designs is presented ranging from small one design boats to vessels built to cross the Atlantic Ocean
Subsequently various aspects of system design and validation are discussed further highlighting the interdisciplinary nature
