Extending Low-rank Matrix Factorizations for Emerging Applications Ke Zhou,2013 Low rank matrix factorizations have become increasingly popular to project high dimensional data into latent spaces with small dimensions in order to obtain better understandings of the data and thus more accurate predictions In particular they have been widely applied to important applications such as collaborative filtering and social network analysis In this thesis I investigate the applications and extensions of the ideas of the low rank matrix factorization to solve several practically important problems arise from collaborative filtering and social network analysis A key challenge in recommendation system research is how to effectively profile new users a problem generally known as emph cold start recommendation In the first part of this work we extend the low rank matrix factorization by allowing the latent factors to have more complex structures decision trees to solve the problem of cold start recommendations In particular we present emph functional matrix factorization fMF a novel cold start recommendation method that solves the problem of adaptive interview construction based on low rank matrix factorizations The second part of this work considers the efficiency problem of making recommendations in the context of large user and item spaces Specifically we address the problem through learning binary codes for collaborative filtering which can be viewed as restricting the latent factors in low rank matrix factorizations to be binary vectors that represent the binary codes for both users and items In the third part of this work we investigate the applications of low rank matrix factorizations in the context of social network analysis Specifically we propose a convex optimization approach to discover the hidden network of social influence with low rank and sparse structure by modeling the recurrent events at different individuals as multi dimensional Hawkes processes emphasizing the mutual excitation nature of the dynamics of event occurrences The proposed framework

combines the estimation of mutually exciting process and the low rank matrix factorization in a principled manner In the fourth part of this work we estimate the triggering kernels for the Hawkes process In particular we focus on estimating the triggering kernels from an infinite dimensional functional space with the Euler Lagrange equation which can be viewed as applying the idea of low rank factorizations in the functional space Linguistics and Language Behavior Abstracts ,1990
