Flight Performance of Fixed and Rotary Wing Aircraft Antonio Filippone, 2006-05-10 Calculation and optimisation of flight performance is required to design or select new aircraft efficiently operate existing aircraft and upgrade aircraft It provides critical data for aircraft certification accident investigation fleet management flight regulations and safety This book presents an unrivalled range of advanced flight performance models for both transport and military aircraft including the unconventional ends of the envelopes Topics covered include the numerical solution of supersonic acceleration transient roll optimal climb of propeller aircraft propeller performance long range flight with en route stop fuel planning zero gravity flight in the atmosphere VSTOL operations ski jump from aircraft carrier optimal flight paths at subsonic and supersonic speed range payload analysis of fixed and rotary wing aircraft performance of tandem helicopters lower bound noise estimation sonic boom and more This book will be a valuable text for undergraduate and post graduate level students of aerospace engineering It will also be an essential reference and resource for practicing aircraft engineers aircraft operations managers and organizations handling air traffic control flight and flying regulations standards safety environment and the complex financial aspects of flying aircraft Unique coverage of fixed and rotary wing aircraft in a unified manner including optimisation emissions control and regulation Ideal for students aeronautical engineering capstone projects and for widespread professional reference in the aerospace industry Comprehensive coverage of computer based solution of aerospace engineering problems the critical analysis of performance data and case studies from real world engineering experience Supported by end of chapter exercises *Mathematical Modelling of Aerospace Dynamic Systems with Practical Applications* Jitendra R. Raol, V.P.S. Naidu, 2025-03-18 *Mathematical Modelling of Aerospace Dynamic Systems with Practical Applications* provides mathematical models for several aerospace dynamic systems aircraft rotorcraft missiles unmanned aerial vehicles UAVs mini air vehicles MAVs autonomous underwater vehicles AUWVs and satellite coordinate systems Presenting the use of mathematical models for analysis prediction and control of these systems this book discusses numerous applications in aircraft helicopter parameter estimation guidance and navigation of these vehicles underwater object search aerial terrain mapping and satellite orbit determination It explains path planning with obstacle avoidance object occlusion detection and tracking and multisensory target tracking and sensor data fusion This book is intended for senior undergraduate mechanical and aerospace engineering students taking courses in aerospace systems and dynamics flight dynamics and control and dynamical systems and estimation Instructors will be able to utilize a Solutions Manual and Figure

Slides for their course *Morphing Aerospace Vehicles and Structures* John Valasek,2012-02-24 Morphing Aerospace Vehicles and Structures provides a highly timely presentation of the state of the art future directions and technical requirements of morphing aircraft Divided into three sections it addresses morphing aircraft bio inspiration and smart structures with specific focus on the flight control aerodynamics bio mechanics materials and structures of these vehicles as well as power requirements and the use of advanced piezo materials and smart actuators The tutorial approach adopted by the contributors including underlying concepts and mathematical formulations unifies the methodologies and tools required to provide practicing engineers and applied researchers with the insight to synthesize morphing air vehicles and morphing structures as well as offering direction for future research *Nonlinear Power Flow Control Design* Rush D. Robinett III,David G. Wilson,2011-08-10 This book presents an innovative control system design process motivated by renewable energy electric grid integration problems The concepts developed result from the convergence of research and development goals which have important concepts in common exergy flow limit cycles and balance between competing power flows A unique set of criteria is proposed to design controllers for a class of nonlinear systems A combination of thermodynamics with Hamiltonian systems provides the theoretical foundation which is then realized in a series of connected case studies It allows the process of control design to be viewed as a power flow control problem balancing the power flowing into a system against that being dissipated within it and dependent on the power being stored in it an interplay between kinetic and potential energies Human factors and the sustainability of self organizing systems are dealt with as advanced topics
