

## BLOOD VESSELS

Blood vessels transport blood around the body. There are three different types of blood vessels in the body: arteries, capillaries and veins.

**artery**

**vein**

**capillary**

### **Arteries:**

Their main function of **arteries** is to carry blood away from the heart. The right ventricle pumps blood into arteries that go to the lungs. The left ventricle pumps blood into a large artery called the **aorta**, which branches out into smaller arteries that reach every organ of the body. The tiny **coronary arteries** carry blood to the heart itself.

**Artery walls are thick.** They consist of 3 layers. The inner layer is made of smooth epithelial cells. The smooth texture allows blood to slide through the artery easily. The middle layer is muscle. The outer wall of an artery is made of strong but flexible connective tissue.

Blood being pumped by the heart exerts a force against the walls of arteries, called **blood pressure**. Blood pressure is caused by the power of the ventricles when they contract. As blood moves further and further away from the heart, blood pressure decreases. Blood pressure is highest in arteries, becomes lower in capillaries and is very low in veins.

The **pulse** that you feel on the arteries in your wrist is caused by the force of your heartbeat. You can determine how fast your heart is beating by counting the number of times per minute that your artery pulses.
