

TERMINOLOGY

Important positions and volumes in reciprocating engine

Engine Cylinder diameter (bore) (D): The nominal inner diameter of the working cylinder.

Piston area (A): The area of a circle of diameter equal to engine cylinder diameter (bore).

$$A = \pi / 4 \times D^2$$

Engine Stroke length (L): The nominal distance through which a working piston moves between two successive reversals of its direction of motion.

Dead center: The position of the working piston and the moving parts, which are mechanically connected to it at the moment when the direction of the piston motion is reversed (at either end point of the stroke).

Bottom dead center (BDC): Dead center when the piston is nearest to the crankshaft. Sometimes it is also called outer dead center (ODC).

Top dead center (TDC): Dead center when the position is farthest from the crankshaft. Sometimes it is also called inner dead center (IDC).

Swept volume (V_s): The nominal volume generated by the working piston when travelling from one dead center to next one, calculated as the product of piston area and stroke. The capacity described by engine manufacturers is the swept volume of the engine, $V_s = A \times L = \pi / 4 \times D^2 L$.

Clearance volume (V_c): The nominal volume of the space on the combustion side of the piston at top dead center.

Practical Engine Airflow John Baechtel, 2015-12-15 The efficient flow of air through an engine is instrumental for producing maximum power To maximize performance engine builders seek to understand how air flows through components and ultimately through the entire engine Engine builders use this knowledge and apply specific practices and principles to unlock horsepower within an engine this applies to all engine types including V 8s V 6s and imported 4 cylinder engines Former Hot Rod magazine editor and founder of Westech Performance Group John Baechtel explains airflow dynamics through an engine in layman s terms so you can easily absorb it and apply it The principles of airflow are explained specifically the physics of air and how it flows through major engine components including the intake heads cylinders and exhaust system The most efficient and least restricted path through an engine is the key to high performance To get to this higher level the author explains atmospheric pressure air density and brake specific fuel consumption so you understand the properties of fuel for tuning Baechtel covers the primary factors for optimizing the airflow path This includes the fundamentals of air motion air velocity and boundary layers obstructions and pressure changes Flowing air through the heads and the combustion chamber is key and is comprehensively explained Also comprehensively explored is the exhaust system s airflow in particular primary tube size and length collector function and scavenging Chapters also include flowbench testing evaluating flow numbers and using airflow software In the simplest terms an engine is an air pump Whether you re a professional engine builder or a serious amateur engine builder you must understand engine airflow dynamics and must apply these principles if you want to optimize performance If you want to achieve ultimate engine performance you need this book

Engine Design Concepts for World Championship Grand Prix Motorcycles Alberto Boretti, 2012-08-06

The World Championship Grand Prix WCGP is the premier championship event of motorcycle road racing. The WCGP was established in 1949 by the sport's governing body the Fédération Internationale de Motocyclisme (FIM) and is the oldest world championship event in the motorsports arena. This book developed especially for racing enthusiasts by motorsports engineering expert Dr Alberto Boretti provides a broad view of WCGP motorcycle racing and vehicles but is primarily focused on the design of four stroke engines for the MotoGP class. The book opens with general background on MotoGP governing bodies and a history of the event's classes since the competition began in 1949. It then presents some of the key engines that have been developed and used for the competition through the years. Technologies that are used in today's MotoGP engines are discussed. A sidebar discussion on calculating brake indicated and friction performance parameters provides mathematical information for readers who like such technical details. Future developments of MotoGP engines including the use of biofuels and recovery of thermal and braking energy are presented. The introduction concludes with a chart that details the winners of the various classes of WCGP motorcycle racing since the competition began in 1949. The bulk of the book consists of four previously published SAE technical papers that were expressly chosen by Dr Boretti to provide greater insight to the relationships between engine parameters and performance namely the influence on friction and mean effective pressure of traditional spark ignited four stroke engines tuned for a narrow high power output. The first paper provides the reader with a quick way to estimate the friction loss and engine output. The second paper discusses output and fuel consumption of multi valve motorcycle engines. The third paper published in 2002 compares WCGP engines developed to comply with the then new FIM regulations that allowed four stroke engines in the competition. The fourth paper examines specific power densities and therefore the level of sophistication and costs of MotoGP 800 cm³ engines. This paper shows the performance of these as well as the 1000cc SuperBike engines. The fifth paper presents four engine concepts including one for a MotoGP Superbike with 2 and 3 cylinders. The sixth paper compares 3 and 4 in line V4, V5 and V6 layouts through 1-D engine simulations. The seventh paper considers the actual operation of 800cc MotoGP engines on the race track where the percentage of the duration in fully open throttle is less than 20% of the race but the partial throttle is used for as much as 80% of the race. The final paper in the compendium reports on the Honda oval piston engine concept.
