Space Administration (NASA),2018-05-29 Data recorded during flights of the NASA Trailblazer Boeing 737 have been
analyzed to ascertain the presence of aircraft structural responses from various excitations such as the engine aerodynamic
effects wind gusts and control system operations The NASA Trailblazer Boeing 737 was chosen as a focus of the study
because of a large quantity of its flight data records The goal of this study was to determine if any aircraft structural
characteristics could be identified from flight data collected for measuring non structural phenomena A number of such data
were examined for spatial and frequency correlation as a means of discovering hidden knowledge of the dynamic behavior of
the aircraft Data recorded from on board dynamic sensors over a range of flight conditions showed consistently appearing
frequencies Those frequencies were attributed to aircraft structural vibrations Butterfield Ansel J Langley Research
