Operations Research and Artificial Intelligence: The Integration of Problem-Solving Strategies Donald E. Brown,Chelsea C. White III,2012-12-06 The purpose of this book is to introduce and explain research at the boundary between two fields that view problem solving from different perspectives Researchers in operations research and artificial intelligence have traditionally remained separate in their activities Recently there has been an explosion of work at the border of the two fields as members of both communities seek to leverage their activities and resolve problems that remain intractable to pure operations research or artificial intelligence techniques This book presents representative results from this current flurry of activity and provides insights into promising directions for continued exploration This book should be of special interest to researchers in artificial intelligence and operations research because it exposes a number of applications and techniques which have benefited from the integration of problem solving strategies Even researchers working on different applications or with different techniques can benefit from the descriptions contained here because they provide insight into effective methods for combining approaches from the two fields Additionally researchers in both communities will find a wealth of pointers to challenging new problems and potential opportunities that exist at the interface between operations research and artificial intelligence In addition to the obvious interest the book should have for members of the operations research and artificial intelligence communities the papers here are also relevant to members of other research communities and development activities that can benefit from improvements to fundamental problem solving approaches

130 Examination of the Society of Actuaries Samuel A. Broverman,1997 **Introduction to Management Science** Bernard W. Taylor,1996 This introduction to the often mathematically rigorous techniques and applications of management science is designed to make the subject accessible for students with no mathematical background or skills It focuses on management science not only as a collection of techniques and processes but as a philosophy and method for approaching problems in a logical manner as skill that is applicable across disciplines and endeavours in all types of jobs and organizations The author s perspective is contemporary his approach hands on and his pedagogy abundant supportive and user friendly for students and instructors alike **A Computation Study on Start Procedures, Basis Change Criteria, and Solution Algorithms for Transportation Problems** Fred Glover,1972 The paper presents an in depth computational comparison of the basic solution algorithms for solving transportation problems The comparison is performed using state of the art computer codes for the dual simplex transportation method the out of kilter method and the primal simplex transportation method often referred to as the Row Column Sum Method or MODI method In addition these codes are compared against a state of the art large scale LP code OPHELIE LP The study discloses that the most efficient solution procedure arises by coupling a primal transportation algorithm embodying recently developed methods for accelerating the determination of basis trees and dual evaluators with a version of the Row Minimum start rule and a modified row first negative evaluator rule The resulting method has been found to be at least 100 times faster than OPHELIE and 6 times faster than a streamlined version of the SHARE out of kilter code The method s median solution time for solving 1000 x 1000 transportation problems on a CDC 6600 computer is 17 seconds with a range of 14 to 22 seconds Author **Models for Public Systems Analysis** Edward J. Beltrami,2013-09-17 Models for Public Systems Analysis considers the mathematical model formulation to improve the delivery of urban service systems such as sanitation fire police and ambulances This book is composed of five chapters that demonstrate the translation of significant societal problems into a mathematical framework as well as the advantages and limitations of these models Chapter 1 deals with the issue of plant location and siting questions with a brief overview of water resource modeling while Chapter 2 provides set covering models for manpower scheduling as a direct outgrowth of the author s experience with the Sanitation Department in New York City Chapters 3 and 4 describe the delivery of emergency services particularly with models of congestion and delay and of optimal deployment These chapters also present probabilistic analysis in nature since both the spatial and the temporal patterns of demand are intrinsically uncertain The tools used are queueing theory and geometric probability Chapter 5 examines network optimization methods mainly to explore questions of vehicle routing and scheduling This chapter also provides a few comments on large scale models of urban growth these being generally more familiar to the regional planner than to the operations analyst This book will prove useful to applied mathematics and policy science students
