Code Structure

```

var ...
//Global variable declaration
function funcA([param1,param2,...])
{
var ...
//Local variable declarations - visible in nested functions
}

function innerFuncA([param1,param2,...])
{
var ...
//Variables local to innerFuncA
//your code here
}

name="ExplainThat!";
//global global variable creation
//your code here
    
```

Nomenclature Rules

Function and variable names can consist of any alphanumeric character (0-9) and are allowed. The first character cannot be numeric. Many standard ASCII characters are allowed. There is no practical limit on name length. Names are case-sensitive.

If two or more variables or functions or a variable & a function are declared with the same name, the last declaration overrides all previous ones. Using a keyword as a variable or function name obliterates that keyword.

Visibility & Scope

Assignments without the use of the var keyword result in a new global variable of that name being created.

Variables declared with the var keyword (within the body of a function) are global. Variables declared with the var keyword inside the body of a function are local to that function. Local variables are visible to all nested functions.

Local entities hide globals bearing the same name.

Variable Types

string: var s = "explainthat" or 'explainthat'
number: var n = 3.14159, 100, 0, ...
Boolean: var flag = false or true
object: var d = new Date();
function: var greet = function sayHello() {alert("hello");}
 JavaScript is a weakly typed language - i.e. a simple assignment is sufficient to change the variable type. The **typeof** keyword can be used to check the current variable type.

Special Values

The special values **false**, **Infinity**, **NaN**, **null**, **true** & **undefined** are recognized. **null** is an object. **Infinity** and **NaN** are numbers.
