

## 7. FLUID TESTING AND PRESSURE LOGS

### 7.1 Introduction

Formation fluid testing involves taking fluid samples from the formation and measuring their pressures. It gives information on the types and properties of fluids in the formation, indicates the presence of hydrocarbons, and provides information on the pressures of the fluids within the formation.

There are three generic types of test, the second of which will be examined in detail as it is a wireline method. The three measurement types are as follows, and are described in the order that they are performed, in their complexity, and therefore their cost.

**Drillstem testing.** This is carried out during the drilling of the well. A portion of perforated drill pipe and one or two devices for sealing the interval of the well of interest off (packers) are lowered down the well to the required depth. The packer is then expanded to make a seal between the borehole wall and the drill pipe. If the bottom of the well is being tested, only one packer is needed. If an interval further up the well is being tested, two packers are needed, one above the interval and one below. A valve is then opened to reduce the pressure within the drill stem and the packed-off interval to surface pressures. Fluids will flow from the formation into the packed-off interval and hence to the surface through the perforations in the drill pipe and up the pipe. These fluids may be sampled and analyzed. Note that this procedure is the equivalent of a temporary completion of the well. (Fig. 7.1).

Figure 7.1 The drillstem test.

**Wireline formation testing (RFT).** This operation is carried out in an open hole during wireline logging operations. The wireline tool is lowered down the uncased hole to the point of interest. It is then jacked and sealed against the borehole wall. Samples of fluids and measurements of the fluid pressures are then taken. Note that this form of logging is not continuous, and is carried out at a few previously defined depths in the reservoir zone of the well only (Fig. 7.2).

## **Petrophysics Msc Course Notes Paul Glover Book:**

Petrophysics Steve Cannon, 2015-09-03 Petrophysics is the science of evaluating the rock and fluid properties of oil gas and water reservoirs through the acquisition of physical samples electrical chemical nuclear and magnetic data acquired by surface logging downhole coring and drilling and wireline sondes The evaluation analysis and interpretation of this data is as much an art as a science as it requires an understanding of geology chemistry physics electronics mechanics and drilling technology The techniques have been developed over the last 100 years primarily by the oil and gas industry but the principles are equally relevant in coal mining hydrogeology and environmental science This book is firmly aimed at students of geology and petroleum engineering looking for a practical understanding of the background and workflows required to complete a petrophysical study of a well a reservoir or a field Petrophysics is log analysis constrained by geology and if we ignore the rocks we risk making poor investment decisions

**Petrophysics** Erle C. Donaldson, Djebbar Tiab, 2004-01-24 The petroleum geologist and engineer must have a working knowledge of petrophysics in order to find oil reservoirs devise the best plan for getting it out of the ground then start drilling This book offers the engineer and geologist a manual to accomplish these goals providing much needed calculations and formulas on fluid flow rock properties and many other topics that are encountered every day New updated material covers topics that have emerged in the petrochemical industry since 1997 Contains information and calculations that the engineer or geologist must use in daily activities to find oil and devise a plan to get it out of the ground Filled with problems and solutions perfect for use in undergraduate graduate or professional courses Covers real life problems and cases for the practicing engineer
