What evidence have scientists gathered to support global climate change?

1899

Continued temperature rise that is clearly discernible in measurements far in the past is one of the key pieces of evidence supporting the theory of global warming. The measurements were made using a variety of instruments and were based on the scientific quality of the data and the methods of data collection. The data are not subject to the same uncertainties as the data collected in the past.

Global Climate Change Demystified James G. Speight, 2019-12-17 Tackling one of the most controversial subjects of our time one of the world s foremost environmental and petroleum engineers explores the potential causes and ramifications of global climate change For too many years climate change also referred to as global warming has been assigned predominantly to the emissions of carbon dioxide through the combustion of fossil fuels It must never be forgotten or ignored however that the Earth has been constantly changing since its formation and has gone through different eras like glaciations among others These changes need thousands of years to be made visible and are likely still continuing given the increase in the average temperature of the Earth since the pre industrial period provided that the measurements of past climatic temperatures are accurate and beyond reproach It follows that the warming trend that has occurred over the past 100 years is very likely to have some origins in natural events as well as in human activity The precise contributions of natural effects and anthropogenic effects on the climate are not known but it is accurate to conclude that

many factors continue to influence climate Whether or not human activities have become a dominant force in the changing climate and are responsible for most of the warming observed is still open to question When studying the climate system of the Earth an area of common confusion is whether climate scientists agree or disagree as to whether or not climate change is happening or if it is happening whether or not humans are the primary cause There are a variety of reasons for this but a majority of scientists who study climate and publish in peer reviewed journals agree that human activity is causing the warming of the Earth The purpose of this book is to weigh all of these various data points and in a scientific and unemotional way arrive at likely conclusions regarding global climate change Whether human activity is the main driver behind our current changes in climate one thing is certain Climate change is happening and we all need to make informed rather than emotional decisions

*Climate Change* Mojib Latif,2009-06-01 There is no doubt climate change is happening and mankind is increasingly to blame Climate Change The Point of No Return provides a solid basis for the current discussion about climate change by addressing the arguments from both sides of the debate and offering an objective evaluation of the facts Using the latest scientific information about the causes of the global climate change Professor Latif presents the likely scenario that will face us if we don't dedicate ourselves to a course of sustainable development and offers concrete options for action

Global Climate Change James C. White,2012-12-06 Bacteria in a test tube and humans on our planet follow the same population curve as time elapses We on this earth largely through control of disease are rapidly approaching maximum population and through energy demands are using up our resources and accumulating wastes We have come to realize the danger of a maturing system but have made essentially no impact in mitigating or preventing the problems we face While we have been able to change the world we live in most of our effects have been to degrade the planet We have nibbled away at the quality of the atmosphere for centuries and the accumulated damage has resulted in changing the world's climate at an ever increasing rate We now face the possibility of higher average temperatures over most of our planet changing patterns of rainfall rising sea levels aggravated storm systems and a myriad of social effects
