**The C++ Report**, 2000 **Optimization of Object-oriented and Concurrent Programs** John Bradley Plevyak, University of Illinois at Urbana-Champaign. Department of Computer Science, 1996 Abstract High level programming language features have long been seen as improving programmer efficiency at some cost in program efficiency When features such as object orientation and fine grained concurrency which greatly simplify expression of complex programs are used parsimoniously their effectiveness is mitigated It is my thesis that these features can be implemented efficiently through interprocedural analysis and transformation By specializing their implementation to the contexts in which they are used the program's efficiency is not adversely affected by the flexibility of the language The specific contributions herein are 1 an adaptive flow analysis for practical precise analysis of object oriented programs 2 a cloning algorithm for building specialized versions of general abstractions 3 a set of

optimizations for removing object oriented and fine grained concurrency overhead and 4 a hybrid sequential parallel execution model which adapts to the availability of data The effectiveness of this framework has been empirically validated on standard benchmarks It is publicly available as part of the Illinois Concert system <http://www.cs.uiuc.edu>
