**Advanced Packaging and Manufacturing Technology Based on Adhesion Engineering** Seonho Seok,2018-04-27 This book introduces microelectromechanical systems MEMS packaging utilizing polymers or thin films a new and unique packaging technology It first investigates the relationship between applied load and opening displacement as a function of benzocyclobutene BCB cap size to find the debonding behavior and then presents BCB cap deformation and stress development at different opening displacements as a function of BCB thickness which is a criterion for BCB cap transfer failure Transfer packaging techniques are attracting increasing interest because they deliver packaging caps from carrier wafers to device wafers and minimize the fabrication issues frequently encountered in thin film or polymer cap encapsulation The book describes very low loss polymer cap or thin film transfer techniques based on anti adhesion coating methods for radio frequency RF MEMS device packaging Since the polymer caps are susceptible to deformation due to their relatively low mechanical stiffness during debonding of the carrier wafer the book develops an appropriate finite element model FEM to simulate the debonding process occurring in the interface between Si carrier wafer and BCB cap Lastly it includes the load displacement curve of different materials and presents a flexible polymer filter and a tunable filter as examples of the applications of the proposed technology

*Challenges in the Packaging of MEMS.* ,1999 Microelectromechanical Systems MEMS packaging is much different from conventional integrated circuit IC packaging Many MEMS devices must interface to the environment in order to perform their intended function and the package must be able to facilitate access with the environment while protecting the device The package must also not interfere with or impede the operation of the MEMS device The die attachment material should be low stress and low outgassing while also minimizing stress relaxation overtime which can lead to scale factor shifts in sensor devices The fabrication processes used in creating the devices must be compatible with each other and not result in damage to the devices Many devices are application specific requiring custom packages that are not commercially available Devices may also need media compatible packages that can protect the devices from harsh environments in which the MEMS device may operate Techniques are being developed to handle process and package the devices such that high yields of functional packaged parts will result Currently many of the processing steps are potentially harmful to MEMS devices and negatively affect yield It is the objective of this paper to review and discuss packaging challenges that exist for MEMS systems and to expose these issues to new audiences from the integrated circuit packaging

community     **MEMS/MOEM Packaging : Concepts, Designs, Materials and Processes** Ken Gilleo,2005-07-11 While MEMS technology has progressed rapidly commercialization of MEMS has been hindered by packaging technology barriers and costs One of the key issues in the industrialization of MEMS MOEM and ultimately Nanoelectrical devices is the development of appropriate packaging solutions for the protection assembly and long term reliable operation This book rigorously examines the properties of the materials used in MEMS and MOEM assembly then evaluates them in terms of their routing electrical performance thermal management and reliability With this as a starting point the book moves on to discuss advanced packaging methods such as molded thermoplastic packages for MEMS wafer assembled RFID and wafer level stacked packaging     *Advanced MEMS Packaging* John H.
