

AP BIOLOGY – CHAPTER 7 Cellular Respiration Outline

I. How cells get energy:

A. Cellular Respiration

1. **Cellular respiration** includes the various metabolic pathways that break down carbohydrates and other metabolites and build up ATP.

2. Cellular respiration requires oxygen and gives off CO₂.
3. Aerobic respiration usually breaks down glucose into CO₂ and H₂O.
4. Overall equation for complete breakdown of glucose requires oxygen (is aerobic):

$$C_6H_{12}O_6 + 6O_2 \rightarrow 6CO_2 + 6H_2O + \text{energy}$$
5. Glucose is high-energy molecule; CO₂ and H₂O are low-energy molecules; process is exergonic and releases energy.
6. Electrons are removed from substrates and received by oxygen, combines with H⁺ to become water.
7. Glucose is oxidized and O₂ is reduced.
8. Buildup of ATP is an endergonic reaction that requires energy.
9. Pathways of aerobic respiration allow energy in glucose to be released slowly; ATP is produced gradually.
10. Rapid breakdown of glucose would lose most energy as non-usable heat.
11. Breakdown of glucose yields synthesis of 36 or 38 ATP; this preserves 39% of energy available in glucose.

B. NAD⁺ and FAD

1. Each metabolic reaction in cellular respiration is catalyzed by its own enzyme.
2. As a metabolite is oxidized, NAD⁺ accepts two electrons and a hydrogen ion (H⁺); results in NADH + H⁺.
3. Electrons received by NAD⁺ and FAD are high-energy electrons and are usually carried to the electron transport system.
4. NAD⁺ is a coenzyme of oxidation-reduction since it both accepts and gives up electrons.
5. Only a small amount of NAD⁺ is needed in cells; each NAD⁺ molecule is used over and over.
6. FAD coenzyme of oxidation-reduction can replace NAD⁺; FAD accepts two electrons, becomes FADH₂.

This is only a general outline. There is much that has been discussed and presented in lecture that is not included in this outline. All material discussed in lecture is test-material whether or not it is included in this outline.

An excerpt from the book: Anaerobic respiration is how cells make energy when, as you may have guessed from the name, there is no available oxygen. In fact, for this process, there is neither oxygen nor mitochondria present. The two processes that allow this to work are those of glycolysis and fermentation. In cellular respiration, what we normally see is glucose breaks down to pyruvate, and from this process, we net 2 ATP. Next, the pyruvate will go into the mitochondria and enter the Krebs cycle. In the process of being converted to acetyl CoA, CO₂ is given off, and another 2 ATP are made. This energy is stored in NADH and FADH₂. Their electrons move into the electron transport chain, which will move to oxygen to transform the product to water. In this, 23-34 ATP are made.
