Marquez, 2019-03-14 Simulink is a block diagram environment for multidomain simulation and Model Based Design It supports system level design simulation automatic code generation and continuous test and verification of embedded systems Simulink provides a graphical editor customizable block libraries and solvers for modeling and simulating dynamic systems It is integrated with MATLAB R enabling you to incorporate MATLAB algorithms into models and export simulation results to MATLAB for further analysis Simulink is a graphical modeling and simulation environment for dynamic systems You can create block diagrams where blocks represent parts of a system A block can represent a physical component a small system or a function an input output relationship fully characterizes the block The definition of a block is only complete with its inputs and outputs and this task relates to the goal of the model For example the cart velocity may be a natural choice as an output if the modeling goal does not involve its location Simulink provides block libraries that are collections of blocks grouped by functionality For example to model a megaphone that simply multiplies its input by a constant you would use a Gain block from the Math Operations library In simulation time progresses differently from a real clock Each time step takes as much time as it takes to finish the computations for that time step whether that time step represents a fraction of a second or a few years Often the effect of a component's input on its output is not instantaneous For example turning on a heater does not result in an instant change in temperature Rather this action provides input to a differential equation and the history of the temperature a state is also a

factor When simulation requires solving a differential or difference equation Simulink employs memory and numerical solvers to compute the state values for the time step At each time step Simulink computes new values for signals and states By contrast you specify parameters when you build the model and can occasionally change them while simulation is running You can use Simulink to model a system and then simulate the dynamic behavior of that system The basic techniques you use to create a simple model in this tutorial are the same as those you use for more complex models Modeling is a way to create a virtual representation of a real world system You can simulate this virtual representation under a wide range of conditions to see how it behaves Modeling and simulation are especially valuable for testing conditions that are difficult to reproduce with hardware prototypes alone This is especially true in the early phase of the design process when hardware is not yet available Iterating between modeling and simulation can improve the quality of the system design early by reducing the number of errors found later in the design process

Simulink Basics James Braselton,2014-08-14 Simulink is a block diagram environment for multidomain simulation and Model Based Design It supports system level design simulation automatic code generation and continuous test and verification of embedded systems Simulink provides a graphical editor customizable block libraries and solvers for modeling and simulating dynamic systems It is integrated with MATLAB enabling you to incorporate MATLAB algorithms into models and export simulation results to MATLAB for further analysis With Simulink you can move beyond idealized linear models to explore more realistic nonlinear models factoring in friction air resistance gear slippage hard stops and the other things that describe real world phenomena Simulink turns your computer into a laboratory for modeling and analyzing systems that would not be possible or practical otherwise Simulink provides a graphical user interface GUI for building models as block diagrams allowing you to draw models as you would with pencil and paper Simulink also includes a comprehensive block library of sinks sources linear and nonlinear components and connectors If these blocks do not meet your needs however you can also create your own blocks The interactive graphical environment simplifies the modeling process eliminating the need to formulate differential and difference equations in a language or program After you define a model you can simulate its dynamic behavior using a choice of mathematical integration methods either from the Simulink menus or by entering commands in the MATLAB Command Window The menus are convenient for interactive work while the command line is useful for running a batch of simulations For example if you are doing Monte Carlo simulations or want to apply a parameter across a range of values you can use MATLAB scripts Using scopes and other display blocks you can see the simulation results while the simulation runs You can then change parameters and see what happens for what if exploration The simulation results can be put in the MATLAB workspace for postprocessing and visualization Model analysis tools include linearization and trimming tools which you can access from the MATLAB command line plus the many tools in MATLAB and its application toolboxes Because MATLAB and Simulink are integrated you can simulate analyze and revise your models in either environment at any point
