Code Structure

```

var ...
//Global variable declarations
function funcA([param1,param2,...])
{
    var ...
    //Local variable declarations - visible in nested functions
}

function innerFuncA([param1,param2,...])
{
    var ...
    //Variables local to innerFuncA
    //your code here
}

//Name="ExplainThat!";
//global global variable creation
//your code here
    
```

Nomenclature Rules

Function and variable names can consist of any alphanumeric character (0-9) and are allowed. The first character cannot be numeric. Many standard ASCII characters are allowed. There is no practical limit on name length. Names are case-sensitive.

If two or more variables or functions or a variable & a function are declared with the same name, the last declaration overrides all previous ones. Using a keyword as a variable or function name obliterates that keyword.

Visibility & Scope

Assignments without the use of the var keyword result in a new global variable of that name being created.

Variables declared with the var keyword within the body of a function are global. Variables declared with the var keyword inside the body of a function are local to that function. Local variables are visible to all nested functions.

Local entities hide globals bearing the same name.

Variable Types

```

string: var s = "explainthat" or "explainthat"
number: var n = 3.14159, 100, 0, ...
boolean: var flag = false or true
object: var d = new Date();
function: var greet = function sayHello() {alert("hello");}
JavaScript is a weakly typed language - i.e. a simple assignment is sufficient to change the variable type. The typed keyword can be used to check the current variable type.
    
```

Special Values

The special values false, infinity, NaN, null, true & undefined are recognized. null is an object. Infinity and NaN are numbers.
