XII Mediterranean Conference on Medical and Biological Engineering and Computing 2010 Nicolas Pallikarakis, Panagiotis D. Bamidis, 2010-05-28 Over the past three decades the exploding number of new technologies and applications introduced in medical practice often powered by advances in biosignal processing and biomedical imaging created an amazing account of new possibilities for diagnosis and therapy but also raised major questions of appropriateness and safety The accelerated development in this field alongside with the promotion of electronic health care solutions is often on the basis of an uncontrolled diffusion and use of medical technology The emergence and use of medical devices is multiplied rapidly and today there exist more than one million different products available on the world market Despite the fact that the rising cost of health care partly resulting from the new emerging technological applications forms the most serious and urgent problem for many governments today another important concern is that of patient safety and user protection issues that should never be compromised and expelled from the Biomedical Engineering research practice agenda

Neuroscience Eilif Muller, James A. Bednar, Markus Diesmann, Marc-Oliver Gewaltig, Michael Hines, Andrew P. Davison, 2015-07-23 Python is rapidly becoming the de facto standard language for systems integration Python has a large user and developer base external to the neuroscience community and a vast module library that facilitates rapid and maintainable development of complex and intricate systems In this Research Topic we highlight recent efforts to develop Python modules for the domain of neuroscience software and neuroinformatics simulators and simulator interfaces data collection and analysis sharing re use storage and databasing of models and data stimulus generation parameter search and optimization visualization VLSI hardware interfacing Moreover we seek to provide a representative overview of existing mature Python modules for neuroscience and neuroinformatics to demonstrate a critical mass and show that Python is an appropriate choice of interpreter interface for future neuroscience software development **Regularized Image Reconstruction in Parallel MRI with MATLAB** Joseph Suresh Paul, Raji Susan Mathew, 2019-11-05 Regularization becomes an integral part of the reconstruction process in accelerated parallel magnetic resonance imaging pMRI due to the need for utilizing the most discriminative information in the form of parsimonious models to generate high quality images with reduced noise and artifacts Apart from providing a detailed overview and implementation details of various pMRI reconstruction methods Regularized image reconstruction in parallel MRI with MATLAB examples interprets regularized image reconstruction in pMRI as a means to effectively control the balance between two specific types of error signals to either improve the accuracy in estimation of missing samples or speed up the estimation process The first type corresponds to the modeling error between acquired and their estimated values The second type arises due to the perturbation of k space values in autocalibration methods or sparse approximation in the compressed sensing based reconstruction model Features Provides details for optimizing regularization parameters in each type of reconstruction Presents comparison of regularization approaches for each type of pMRI reconstruction Includes discussion of case studies using clinically acquired data MATLAB codes are provided for each reconstruction type Contains method wise description of adapting regularization to optimize speed and accuracy This book serves as a reference material for researchers and students involved in development of pMRI reconstruction methods Industry practitioners concerned with how to apply regularization in pMRI reconstruction will find this book most useful *Science Abstracts*, 1995 *Fundamentals of Magnetic Resonance Imaging with Image Reconstruction Simulated by MATLAB* Jintong Mao, 2019-11-21 This version of the book is in color printing with a little minor revision Starting from complex free induction decay FID this book establishes a logical framework for the discussion of the principle of MRI Based on the framework traditional topics and some new topics are described in detail Every formula is derived step by step at length Essence of MRI is thoroughly discussed It is emphasized that Fourier transform FT in MRI is a natural result from data acquisition with linear field gradient Each concept particularly the concept of echo is explained in great detail For example it is indicated that the popular drawing of an echo following FID in time axis

is misleading in MRI but not NMR An echo cannot be considered as two back to back FID etc If you cannot accept these statements immediately you may need to refresh your basic knowledge of MRI The procedure from FID to MR image is accomplished by a pair of FT The first FT is established naturally from echo acquisition Analog digital converter leads to discrete FID From Nyquist sampling and quadrature phase sensitive detection PSD formula $FOV_{dk} = \frac{2\pi}{dk}$ is derived From $FOV_{dk} = \frac{2\pi}{dk}$ discrete FT is derived by the summation of discrete FID directly without relying on continuous FT Thus discrete FID leads to discrete FT On other side a discrete echo is the summation of acquired discrete FID if re phasing linear gradient field follows de phasing gradient field Thus discrete FID also leads to discrete echo We have that the discrete echo is a discrete FT one dimensional A series of echoes is obtained by phase encoding raw data in two dimensional k space The k space is therefore a two dimensional discrete FT first FT The reconstructed image is obtained by applying inverse FT second FT to the series of discrete echoes k space Continuous FT is used as a heuristic step But it is not necessary for the discussion of MRI As an example from FID to MR image simulated images are obtained for graphical phantoms by using MATLAB In appendix MATLAB codes for image reconstruction and frequency selective pulses are included Based on the framework the topics include basic pulse sequences pulse train image contrasts signal to noise ratio ringing artifacts aliasing artifacts improvement of slice profile of selective pulses Bloch equation is solved numerically using Runge Kutta method fat suppression magnetization transfer diffusion flow image functional MRI fMRI for a perceptual alternation is presented etc Inside of the framework emphasized topics include pulsatile ghost artifact for flow it is simulated by MATLAB and explained by interleaved zero data in k space experiments show that traditional explanation of flow mis registration is not correct the experiment also shows that the profile of laminar flow looks like a long needle instead of ellipsoid Stejskal Tanner formula for b value can be obtained by a wrong derivation thus the correctness of the formula may be in question the strength of refocusing gradient for 90d selective pulse is 0.515 instead of commonly used 0.5 small difference in refocusing strength leads to a large difference in refocusing effects due to non linearity of Bloch equation etc In addition to above topics Bloch equation with the terms T1 T2 diffusion flow etc is derived by adding independent contributions to $\frac{dM}{dt}$ with a reasonable assumption It is the hope this book is readable It is the hope that the journey through the book is a joy particularly for the first part of the book This book will be of value to beginners Perhaps it is valuable to a more extensive readership as well
