News is Good News John Y. Campbell,Ludger Hentschel,1991 It is sometimes argued that an increase in stock market volatility raises required stock returns and thus lowers stock prices This paper modifies the generalized autoregressive conditionally heteroskedastic GARCH model of returns to allow for this volatility feedback effect The resulting model is asymmetric because volatility feedback amplifies large negative stock returns and dampens large positive returns making stock returns negatively skewed and increasing the potential for large crashes The model also implies that volatility feedback is more important when volatility is high In U S monthly and daily data in the period 1926 88 the asymmetric model fits the data better than the standard GARCH model accounting for almost half the skewness and excess kurtosis of standard monthly GARCH residuals Estimated volatility discounts on the stock market range from 1% in normal times to 13% after the stock market crash of October 1987 and 25% in the early 1930 s However volatility feedback has little effect on the unconditional variance of stock returns *journal of financial economics* ,1995
