Reasoning with Probabilistic and Deterministic Graphical Models Rina Dechter, 2019-02-14 Graphical models e.g. Bayesian and constraint networks influence diagrams and Markov decision processes have become a central paradigm for knowledge representation and reasoning in both artificial intelligence and computer science in general. These models are used to perform many reasoning tasks such as scheduling, planning, and learning, diagnosis and prediction, design, hardware and software verification, and bioinformatics. These problems can be stated as the formal tasks of constraint satisfaction and satisfiability, combinatorial optimization, and probabilistic inference. It is well known that the tasks are computationally hard, but research during the past three decades has yielded a variety of principles and techniques that significantly advanced the state of the art. This book provides comprehensive coverage of the primary exact algorithms for reasoning with such models. The main feature exploited by the algorithms is the model's graph. We present inference-based message passing schemes e.g. variable elimination and search-based conditioning schemes e.g. cycle cutset conditioning and AND/OR search. Each class possesses distinguished characteristics and in particular has different time vs. space behavior. We emphasize the dependence of both schemes on few graph parameters such as the treewidth, cycle cutset, and the pseudo tree height. The new edition includes the notion of influence diagrams which focus on sequential decision making under uncertainty. We believe the principles outlined in the book would serve well in moving forward to approximation and anytime-based schemes. The target audience of this book is researchers and students in the artificial intelligence and machine learning area and beyond.

Probabilistic Graphical Models Daphne Koller, Nir Friedman, 2009-07-31 A general framework for constructing and using probabilistic models of complex systems that would enable a computer to use available information for making decisions. Most tasks require a person or an automated system to reason to reach conclusions based on available information. The framework of probabilistic graphical models presented in this book provides a general approach for this task. The approach is model-based, allowing interpretable models to be constructed and then manipulated by reasoning algorithms. These models can also be learned automatically from data, allowing the approach to be used in cases where manually constructing a model is difficult or even impossible. Because uncertainty is an inescapable aspect of most real-world applications, the book focuses on probabilistic models which make the uncertainty explicit and provide models that are more faithful to reality. Probabilistic Graphical Models discusses a variety of models spanning Bayesian networks, undirected Markov networks, discrete and continuous models, and extensions to deal with dynamical systems and relational data. For each class of models, the text describes the three fundamental cornerstones: representation, inference, and learning, presenting both basic concepts and advanced techniques. Finally, the book considers the use of the proposed framework for causal reasoning and decision making under uncertainty. The main text in each chapter provides the detailed technical development of the key ideas. Most chapters also include boxes with additional material: skill boxes which describe techniques, case study boxes which

discuss empirical cases related to the approach described in the text including applications in computer vision robotics natural language understanding and computational biology and concept boxes which present significant concepts drawn from the material in the chapter Instructors and readers can group chapters in various combinations from core topics to more technically advanced material to suit their particular needs

Decision Theory Models for Applications in Artificial Intelligence: Concepts and Solutions Sucar, L. Enrique, Morales, Eduardo F., Hoey, Jesse, 2011-10-31 One of the goals of artificial intelligence AI is creating autonomous agents that must make decisions based on uncertain and incomplete information The goal is to design rational agents that must take the best action given the information available and their goals Decision Theory Models for Applications in Artificial Intelligence Concepts and Solutions provides an introduction to different types of decision theory techniques including MDPs POMDPs Influence Diagrams and Reinforcement Learning and illustrates their application in artificial intelligence This book provides insights into the advantages and challenges of using decision theory models for developing intelligent systems

Exploitation of Linkage Learning in Evolutionary Algorithms Ying-ping Chen, 2010-04-16 One major branch of enhancing the performance of evolutionary algorithms is the exploitation of linkage learning This monograph aims to capture the recent progress of linkage learning by compiling a series of focused technical chapters to keep abreast of the developments and trends in the area of linkage In evolutionary algorithms linkage models the relation between decision variables with the genetic linkage observed in biological systems and linkage learning connects computational optimization methodologies and natural evolution mechanisms Exploitation of linkage learning can enable us to design better evolutionary algorithms as well as to potentially gain insight into biological systems Linkage learning has the potential to become one of the dominant aspects of evolutionary algorithms research in this area can potentially yield promising results in addressing the scalability issues

Advances in Computational Intelligence Jing Liu, Cesare Alippi, Bernadette Bouchon-Meunier, Garrison W. Greenwood, Hussein A. Abbass, 2012-07-06 This state of the art survey offers a renewed and refreshing focus on the progress in evolutionary computation in neural networks and in fuzzy systems The book presents the expertise and experiences of leading researchers spanning a diverse spectrum of computational intelligence in these areas The result is a balanced contribution to the research area of computational intelligence that should serve the community not only as a survey and a reference but also as an inspiration for the future advancement of the state of the art of the field The 13 selected chapters originate from lectures and presentations given at the IEEE World Congress on Computational Intelligence WCCI 2012 held in Brisbane Australia in June 2012

and in medicine A nagging concern however is how accurately these networks represent the biology For complex systems like biological networks there are practical limits on how well even massive amounts of data can uniquely define the underlying structure and yield useful predictions of measurable events Indeed although its advocates call this process reverse engineering the topology and the detailed molecular interactions of the inferred networks will likely never be known with precision This volume captures the ongoing process to assess the ability of scientists and their computer servants to infer networks from experimental data by comparing their predictions to gold standard networks whose structure is thought to be known NOTE Annals volumes are available for sale as individual books or as a journal For information on institutional journal subscriptions please visit [www blackwellpublishing com](http://www.blackwellpublishing.com) nyas ACADEMY MEMBERS Please contact the New York Academy of Sciences directly to place your order [www nyas org](http://www.nyas.org) Members of the New York Academy of Science receive full text access to the Annals online and discounts on print volumes Please visit [www nyas org membership main asp](http://www.nyas.org/membership/main.asp) for more information about becoming a member
