Closed Loop Motion Control For Mobile Robotics:

Motion Control for Dynamic Mobile Robots Hong Zhang, 2000 In this thesis we present research results on sensor based motion planning and nonlinear control for mobile robotic systems In sensor based motion planning we use ideas from game theory to deal with the uncertainties accompanying real sensors and moving obstacles We show that this idea can be successfully applied to both open loop and closed loop motion planning and control algorithms With the emphasis on the use of a vision sensor we extend the concept of sensor based motion planning to motion planning in the image plane which can help us to bypass the calibration errors associated with vision based control and achieve faster response speeds Meanwhile we address the effect of dynamics in vision based motion control or visual servoing and expanded our ability to control a dynamic robotic system such as the blimp robot

The book reveals many different aspects of motion control and a wide multiplicity of approaches to the problem as well. Despite the number of examples however this volume is not meant to be exhaustive it intends to offer some original insights for all researchers who will hopefully make their experience available for a forthcoming publication on the subject [Motion Control of Underactuated Mechanical Systems](#) Javier Moreno-Valenzuela, Carlos

Aguilar-Avelar, 2017-07-11 This volume is the first to present a unified perspective on the control of underactuated mechanical systems. Based on real time implementation of parameter identification this book provides a variety of algorithms for the Furuta pendulum and the inertia wheel pendulum which are two degrees of freedom mechanical systems. Specifically this work addresses and solves the problem of motion control via trajectory tracking in one joint coordinate while another joint is regulated. Besides discussions on extensions to higher degrees of freedom systems are given. The book aimed at control engineers as well as graduate students ranges from the problem of parameter identification of the studied systems to the practical implementation of sophisticated motion control algorithms. Offering real world solutions to manage the control of underactuated systems this book provides a concise tutorial on recent breakthroughs in the field original procedures to achieve bounding of the error trajectories convergence and gain tuning guidelines **Introduction to Mobile Robot**
