

Development Trends of Soft Magnetic Iron

Thanks to advances in electronically controlled systems for automobiles, the demand is growing for soft magnetic materials that can process a large electromagnetic flux with low eddy current losses. This study will try to surface various types of iron developed in combination of state-of-the-art electromagnetic properties such as permeability and resistivity. This paper describes the recent development trends of soft magnetic steel and the achievement of one developed steel (DCEM) series.

Introduction

Recently automobiles are being heavily equipped with various systems operated electronically, electronically and/or electrohydraulically to control valves, control and fuel economy. Such systems include integrated controlled automatic transmission, electronic power steering (EPS) and anti-lock braking systems (ABS)^{1,2}.

In the early years (1970s, 1980s) when electric and electronic devices started to be used in automobiles, the main purpose was to improve and upgrade the performance of individual systems. Highly complicated vehicles started to appear, however, in steering, fuel injection, high-speed valves and movements coordinated among different systems. Hence electronically and/or electrohydraulically controlled components are becoming increasingly important.

Among these electronically and/or electrohydraulically controlled systems, components that utilize electromagnetic force (permeable iron core or thin shell to generate magnetic field, many conventional cores consist of low carbon steel, containing about 0.1% of carbon), to improve the response to control signals and increase energy efficiency.³ With the remarkable advancement of electromagnetic control in recent years, it has become essential to electronically components to have even higher performance and lower power consumption.

This paper describes the trend of soft magnetic materials, such as those for iron cores used in electromagnetic components, and introduces the characteristics of the new, low-loss soft magnetic materials in the DCEM (Steel Low Carbon Cold Heading Steel) series developed by Tokai Steel.

by hydraulic control. This is a typical example of the electromagnetic components used in automobiles. Soft magnetic materials are usually used for iron cores that use magnetic circuits and for the bearings including cores.

Early solenoid devices for automobiles were mainly used for controlling the oil flow by small solenoids. Thus, the reliability and availability of iron core materials were more important than their magnetic characteristics. As a result, low carbon steels such as SAE1010, SAE1015, SAE1018 and SAE1020 (JIS-C 1008) were used for the iron cores.

Recent solenoid devices, however, must be able to control hydraulic media, and water. In solenoid coils, the small current is being replaced by larger current in many cases.^{4,5} On the other hand, the control current must be proportional to the galling force (electromagnetic force) of the iron cores, which increases with magnetic materials having low permeability (low hysteresis) at high flux density. The latest iron core materials for these solenoids are required to have magnetic characteristics better than those of SAE1018 (JIS-C 1018), making it difficult to use carbon steel directly used for small current, to satisfy the required characteristics of magnetic materials and accuracy (Fig. 2).

In the mid-1980s, Tokai Steel worked to totally eliminate factors that can adversely affect the magnetic characteristics of soft magnetic materials and developed a soft magnetic material, DCEM, based on pure iron, which can achieve the best characteristics among all grades (99.997% minimum). The company has studied pure ferritic iron, in ferritic iron, and pure ferritic iron that treated is being widely used as a soft magnetic material for coil ferrite.

In the late 1990s, there was an increasing demand for
