Stucki,2013-11-11 Digital image processing originally established to analyze and improve lunar images is rapidly growing into a wealth of new applications due to the enormous technical progress made in computer engineering At present the most important fields of growth appear to emerge in the areas of medical image processing i e tomography thermography earth resource inventory i e land usage minerals office automation i e document storage retrieval and reproduction and industrial

production i.e. computer vision for mechanical robots. Currently emphasis is being shifted from signal processing research and design innovation activities towards cost efficient system implementations for interactive digital image processing. For the years ahead trends in computer engineering indicate still further advances in Large Scale Integration LSI and Input Output I/O technologies allowing the implementation of powerful parallel and/or distributed processor architectures for real time processing of high resolution achromatic and color images. In view of the many new developments in the field of digital image processing and recognizing the importance of discussing these developments amongst key scientists that might make use of them, IFM Germany sponsored an international symposium on Advances in Digital Image Processing held at Bad Neuenahr Federal Republic of Germany September 26-28 1978. The interest shown in this symposium encouraged the publication of the papers presented in this volume of the IFM Research Symposium Series *Principles of Digital Image Processing* Wilhelm Burger, Mark J. Burge, 2013-11-18. This textbook is the third of three volumes which provide a modern algorithmic introduction to digital image processing designed to be used both by learners desiring a firm foundation on which to build and practitioners in search of critical analysis and concrete implementations of the most important techniques. This volume builds upon the introductory material presented in the first two volumes with additional key concepts and methods in image processing. Features practical examples and carefully constructed chapter ending exercises, real implementations, concise mathematical notation and precise algorithmic descriptions designed for programmers and practitioners, easily adaptable Java code and completely worked out examples for easy inclusion in existing applications, uses ImageJ, provides a supplementary website with the complete Java source code, test images and corrections, additional presentation tools for instructors including a complete set of figures, tables and mathematical elements.
