models such as long short term memory LSTM and convolutional neural networks CNN perform on the task of decoding motor imagery movements from EEG signals For this task both a LSTM and a CNN model are developed using the latest advances in deep learning such as batch normalization dropout and cropped training strategies for data augmentation Evaluation is performed on a novel EEG dataset consisting of 20 healthy subjects The LSTM model reaches the state of the art performance of support vector machines with a cross validated accuracy of 66.20% The CNN model that employs a time frequency transformation in its first layer outperforms the LSTM model and reaches a mean accuracy of 84.23% This shows that deep learning approaches deliver competitive performance without the need for hand crafted features enabling end to end classification
