**Approaches to Algebra** N. Bednarz, C. Kieran, L. Lee, 2012-12-06 In Greek geometry there is an arithmetic of magnitudes in which in terms of numbers only integers are involved This theory of measure is limited to exact measure Operations on magnitudes cannot be actually numerically calculated except if those magnitudes are exactly measured by a certain unit The theory of proportions does not have access to such operations It cannot be seen as an arithmetic of ratios Even if Euclidean geometry is done in a highly theoretical context its axioms are essentially semantic This is contrary to Mahoney's second characteristic This cannot be said of the theory of proportions which is less semantic Only synthetic proofs are considered rigorous in Greek geometry Arithmetic reasoning is also synthetic going from the known to the unknown Finally analysis is an approach to

geometrical problems that has some algebraic characteristics and involves a method for solving problems that is different from the arithmetical approach

3 GEOMETRIC PROOFS OF ALGEBRAIC RULES Until the second half of the 19th century Euclid's Elements was considered a model of a mathematical theory This may be one reason why geometry was used by algebraists as a tool to demonstrate the accuracy of rules otherwise given as numerical algorithms It may also be that geometry was one way to represent general reasoning without involving specific magnitudes To go a bit deeper into this here are three geometric proofs of algebraic rules the first by Al Khwarizmi the other two by Cardano
