engagement new methods for synthesis of drug candidates such as green chemistry development of novel scaffolds for drug discovery and the role of regulatory agencies in drug discovery Reviews the strategies technologies principles and applications of modern medicinal chemistry Provides a global and current perspective of today s drug discovery process and discusses the major therapeutic classes and targets Includes a unique collection of case studies and personal assays reviewing the discovery and development of key drugs

The nth-Order Comprehensive Adjoint Sensitivity Analysis Methodology, Volume I Dan Gabriel Cacuci, 2022-07-19 The computational models of physical systems comprise parameters independent and dependent variables Since the physical processes themselves are seldom known precisely and since most of the model parameters stem from experimental procedures which are also subject to imprecisions the results predicted by these models are also imprecise being affected by the uncertainties underlying the respective model The functional derivatives also called sensitivities of results also called responses produced by mathematical computational models are needed for many purposes including i understanding the model by ranking the importance of the various model parameters ii performing reduced order modeling by eliminating unimportant parameters and or processes iii quantifying the uncertainties induced in a model response due to model parameter uncertainties iv performing model validation by comparing computations to experiments to address the question does the model represent reality v prioritizing improvements in the model vi performing data assimilation and model calibration as part of forward predictive modeling to obtain best estimate predicted results with reduced predicted uncertainties vii performing inverse predictive modeling viii designing and optimizing the system This 3 Volume monograph describes a comprehensive adjoint sensitivity analysis methodology developed by the author which enables the efficient and exact computation of arbitrarily high order sensitivities of model responses in large scale systems comprising many model parameters The qualifier comprehensive is employed to highlight that the model parameters considered within the framework of this methodology also include the system s uncertain boundaries and internal interfaces in phase space The model s responses can be either scalar valued functionals of the model s parameters and state variables e g as customarily encountered in optimization problems or general function valued responses Since linear operators admit bona fide adjoint operators responses of models that are linear in the state functions i e dependent variables can depend simultaneously on both the forward and the adjoint state functions Hence the sensitivity analysis of such responses warrants the treatment of linear systems in their own right rather than treating them as particular cases of nonlinear systems This is in contradistinction to responses for nonlinear systems which can depend only on the forward state functions since nonlinear operators do not admit bona fide adjoint operators only a linearized form of a nonlinear operator may admit an adjoint operator Thus Volume 1 of this book presents the mathematical framework of the nth Order Comprehensive Adjoint Sensitivity Analysis Methodology for Response Coupled Forward Adjoint Linear Systems abbreviated as nth CASAM L which is conceived for the most efficient computation of exactly obtained mathematical

expressions of arbitrarily high order n th order sensitivities of a generic system response with respect to all of the parameters underlying the respective forward adjoint systems Volume 2 of this book presents the application of the n th CASAM L to perform a fourth order sensitivity and uncertainty analysis of an OECD NEA reactor physics benchmark which is representative of a large scale model comprises many 21 976 uncertain parameters thereby amply illustrating the unique potential of the n th CASAM L to enable the exact and efficient computation of chosen high order response sensitivities to model parameters Volume 3 of this book presents the n th Order Comprehensive Adjoint Sensitivity Analysis Methodology for Nonlinear Systems abbreviation n th CASAM N for the practical efficient and exact computation of arbitrarily high order sensitivities of responses to model parameters for systems that are also nonlinear in their underlying state functions Such computations are not feasible with any other methodology The application of the n th CASAM L and the n th CASAM N overcomes the so called curse of dimensionality in sensitivity and uncertainty analysis thus revolutionizing all of the fields of activities which require accurate computation of response sensitivities Since this monograph includes many illustrative fully worked out paradigm problems it can serve as a textbook or as supplementary reading for graduate courses in academic departments in the natural sciences and engineering
