millions of machines being sold and discarded annually Powerful machines are produced for only a few hundred U S dollars and one of the problems faced by vendors of these machines is that due to the continuing adherence to Moore s law where the speed of such machines doubles about every 18 months we typically have more than enough computer power for our needs for word processing surfing the web or playing video games However the same cannot be said for applications that require large powerful machines Applications such as weather and climate prediction fluid flow for designing new airplanes or automobiles or nuclear plasma flow require as much computer power as we can provide and even that is not enough Today s machines operate at the teraflop level trillions of floating point operations per second and this book describes research into the petaflop region 1 015 FLOPS The six chapters provide an overview of current activities that will provide for the introduction of these machines in the years 2011 through 2015
