Distributed Network Systems Weijia Jia, Wanlei Zhou, 2006-06-14 Both authors have taught the course of Distributed Systems for many years in the respective schools During the teaching we feel strongly that Distributed systems have evolved from traditional LAN based distributed systems towards Internet based systems Although there exist many excellent textbooks on this topic because of the fast development of distributed systems and network programming protocols we have difficulty in finding an appropriate textbook for the course of distributed systems with orientation to the requirement of the undergraduate level study for today s distributed technology Specifically from to date concepts algorithms and models to implementations for both distributed system designs and application programming Thus the philosophy behind this book is to integrate the concepts algorithm designs and implementations of distributed systems based on network programming After using several materials of other textbooks and research books we found that many texts treat the distributed systems with separation of concepts algorithm design and network programming and it is very difficult for students to map the concepts of distributed systems to the algorithm design prototyping and implementations This book intends to enable readers especially postgraduates and senior undergraduate level to study up to date concepts algorithms and network programming skills for building modern distributed systems It enables students not only to master the concepts of distributed network system but also to readily use the material introduced into implementation practices

Security in Computing Systems Joachim Biskup,2008-11-14 This monograph on Security in Computing Systems Challenges Approaches and Solutions aims at introducing surveying and assessing the fundamentals of security with respect to computing Here computing refers to all activities which individuals or groups directly or indirectly perform by means of computing systems i.e. by means of computers and networks of them built on telecommunication We all are such individuals whether enthusiastic or just bowed to the inevitable So as part of the information society we are challenged to maintain our values to pursue our goals and to enforce our interests by consciously designing a global information infrastructure on a large scale as well as by appropriately configuring our personal computers on a small scale As a result we hope to achieve secure computing Roughly speaking computer assisted activities of individuals and computer mediated cooperation between individuals should happen as required by each party involved and nothing else which might be harmful to any party should occur The notion of security circumscribes many aspects ranging from human qualities to technical enforcement First of all in considering the explicit security requirements of users administrators and other persons concerned we hope that usually all persons will follow the stated rules but we also have to face the possibility that some persons might deviate from the wanted behavior whether accidentally or maliciously

Distributed Systems Andrew S. Tanenbaum, Maarten van Steen,2002 Based on the formula of Tanenbaum's Distributed Operating Systems this text covers seven key principles of distributed systems communications processes naming synchronization consistency and replication fault tolerance and security

Distributed Systems for System Architects Paulo Verissimo, Luís Rodrigues,2012-12-06 The primary audience for this book are advanced undergraduate students and graduate students Computer architecture as it happened in other fields such as electronics evolved from the small to the large that is it left the realm of low level hardware constructs and gained new dimensions as distributed systems became the keyword for system implementation As such the system architect today assembles pieces of hardware that are at least as large as a computer or a network router or a LAN hub and assigns pieces of software that are self contained such as client or server programs Java applets or protocol modules to those hardware components The freedom she/he now has is tremendously challenging The problems alas have increased too What was before mastered and tested carefully before a fully fledged mainframe or a closely coupled computer cluster came out on the market is today left to the responsibility of computer engineers and scientists invested in the role of system architects who fulfil this role on behalf of software vendors and integrators add value system developers R D institutes and final users As system complexity size and diversity grow so increases the probability of inconsistency unreliability non responsiveness and insecurity not to

mention the management overhead What System Architects Need to Know The insight such an architect must have includes but goes well beyond the functional properties of distributed systems
