

Additional Exercises for *Convex Optimization*

Stephen Boyd

Lieven Vandenberghe

May 26, 2017

This is a collection of additional exercises, meant to supplement those found in the book *Convex Optimization*, by Stephen Boyd and Lieven Vandenberghe. These exercises were used in several courses on convex optimization, EE364a (Stanford), EE236b (UCLA), or 6.975 (MIT), usually for homework, but sometimes as exam questions. Some of the exercises were originally written for the book, but were removed at some point. Many of them include a computational component using CVX, a Matlab package for convex optimization; files required for these exercises can be found at the book web site www.stanford.edu/~boyd/cvxbook/. We are in the process of adapting many of these problems to be compatible with two other packages for convex optimization: CVXPY (Python) and Convex.jl (Julia). Some of the exercises require a knowledge of elementary analysis.

You are free to use these exercises any way you like (for example in a course you teach), provided you acknowledge the source. In turn, we gratefully acknowledge the teaching assistants (and in some cases, students) who have helped us develop and debug these exercises. Pablo Parrilo helped develop some of the exercises that were originally used in 6.975, and the instructors of EE364a during summer quarters helped develop others.

Course instructors can obtain solutions by email to us. Please specify the course you are teaching and give its URL.

We'll update this document as new exercises become available, so the exercise numbers and sections will occasionally change. We have categorized the exercises into sections that follow the book chapters, as well as various additional application areas. Some exercises fit into more than one section, or don't fit well into any section, so we have just arbitrarily assigned these.

Bulletin Institute of Mathematics and Its Applications, 1994 [International Aerospace Abstracts](#) , 1995 **Forthcoming Books** Rose Army, 2003-12 [Conference Record of the Thirty-Eighth Asilomar Conference on Signals, Systems & Computers, November 7-10, 2004, Pacific Grove, California](#) Michael B. Matthews, 2004 **Books in Print Supplement** , 1984 **Mathematical Reviews** , 1970 **Convex Optimization & Euclidean Distance Geometry** Jon Dattorro, 2005 The study of Euclidean distance matrices EDMs fundamentally asks what can be known geometrically given only distance information between points in Euclidean space Each point may represent simply location or abstractly any entity expressible as a vector in finite dimensional Euclidean space The

answer to the question posed is that very much can be known about the points the mathematics of this combined study of geometry and optimization is rich and deep Throughout we cite beacons of historical accomplishment The application of EDMs has already proven invaluable in discerning biological molecular conformation The emerging practice of localization in wireless sensor networks the global positioning system GPS and distance based pattern recognition will certainly simplify and benefit from this theory We study the pervasive convex Euclidean bodies and their various representations In particular we make convex polyhedra cones and dual cones more visceral through illustration and we study the geometric relation of polyhedral cones to nonorthogonal bases biorthogonal expansion We explain conversion between halfspace and vertex descriptions of convex cones we provide formulae for determining dual cones and we show how classic alternative systems of linear inequalities or linear matrix inequalities and optimality conditions can be explained by generalized inequalities in terms of convex cones and their duals The conic analogue to linear independence called conic independence is introduced as a new tool in the study of classical cone theory the logical next step in the progression linear affine conic Any convex optimization problem has geometric interpretation This is a powerful attraction the ability to visualize geometry of an optimization problem We provide tools to make visualization easier The concept of faces extreme points and extreme directions of convex Euclidean bodies is explained here crucial to understanding convex optimization The convex cone of positive semidefinite matrices in particular is studied in depth We mathematically interpret for example its inverse image under affine transformation and we explain how higher rank subsets of its boundary united with its interior are convex The Chapter on Geometry of convex functions observes analogies between convex sets and functions The set of all vector valued convex functions is a closed convex cone Included among the examples in this chapter we show how the real affine function relates to convex functions as the hyperplane relates to convex sets Here also pertinent results for multidimensional convex functions are presented that are largely ignored in the literature tricks and tips for determining their convexity and discerning their geometry particularly with regard to matrix calculus which remains largely unsystematized when compared with the traditional practice of ordinary calculus Consequently we collect some results of matrix differentiation in the appendices The Euclidean distance matrix EDM is studied its properties and relationship to both positive semidefinite and Gram matrices We relate the EDM to the four classical axioms of the Euclidean metric thereby observing the existence of an infinity of axioms of the Euclidean metric beyond the triangle inequality We proceed by deriving the fifth Euclidean axiom and then explain why furthering this endeavor is inefficient because the ensuing criteria while describing polyhedra grow linearly in complexity and number Some geometrical problems solvable via EDMs EDM problems posed as convex optimization and methods of solution are presented eg we generate a recognizable isotonic map of the United States using only comparative distance information no distance information only distance inequalities We offer a new proof of the classic Schoenberg criterion that determines whether a candidate matrix is an EDM Our proof relies on fundamental geometry assuming any

EDM must correspond to a list of points contained in some polyhedron possibly at its vertices and vice versa It is not widely known that the Schoenberg criterion implies nonnegativity of the EDM entries proved here We characterize the eigenvalues of an EDM matrix and then devise a polyhedral cone required for determining membership of a candidate matrix in Cayley Menger form to the convex cone of Euclidean distance matrices EDM cone ie a candidate is an EDM if and only if its eigenspectrum belongs to a spectral cone for EDM N We will see spectral cones are not unique In the chapter EDM cone we explain the geometric relationship between the EDM cone two positive semidefinite cones and the ellipsope We illustrate geometric requirements in particular for projection of a candidate matrix on a positive semidefinite cone that establish its membership to the EDM cone The faces of the EDM cone are described but still open is the question whether all its faces are exposed as they are for the positive semidefinite cone The classic Schoenberg criterion relating EDM and positive semidefinite cones is revealed to be a discretized membership relation a generalized inequality a new Farkas like lemma between the EDM cone and its ordinary dual A matrix criterion for membership to the dual EDM cone is derived that is simpler than the Schoenberg criterion We derive a new concise expression for the EDM cone and its dual involving two subspaces and a positive semidefinite cone Semidefinite programming is reviewed with particular attention to optimality conditions of prototypical primal and dual conic programs their interplay and the perturbation method of rank reduction of optimal solutions extant but not well known We show how to solve a ubiquitous platonic combinatorial optimization problem from linear algebra the optimal Boolean solution x to $Ax \leq b$ via semidefinite program relaxation A three dimensional polyhedral analogue for the positive semidefinite cone of 3×3 symmetric matrices is introduced a tool for visualizing in 6 dimensions In EDM proximity we explore methods of solution to a few fundamental and prevalent Euclidean distance matrix proximity problems the problem of finding that Euclidean distance matrix closest to a given matrix in the Euclidean sense We pay particular attention to the problem when compounded with rank minimization We offer a new geometrical proof of a famous result discovered by Eckart Young in 1936 regarding Euclidean projection of a point on a subset of the positive semidefinite cone comprising all positive semidefinite matrices having rank not exceeding a prescribed limit ρ We explain how this problem is transformed to a convex optimization for any rank ρ

Optimization on Solution Sets of Common Fixed Point Problems Alexander J. Zaslavski, 2021 This book is devoted to a detailed study of the subgradient projection method and its variants for convex optimization problems over the solution sets of common fixed point problems and convex feasibility problems These optimization problems are investigated to determine good solutions obtained by different versions of the subgradient projection algorithm in the presence of sufficiently small computational errors The use of selected algorithms is highlighted including the Cimmino type subgradient the iterative subgradient and the dynamic string averaging subgradient All results presented are new Optimization problems where the underlying constraints are the solution sets of other problems frequently occur in applied mathematics The reader should not miss the section in Chapter 1 which considers

some examples arising in the real world applications The problems discussed have an important impact in optimization theory as well The book will be useful for researches interested in the optimization theory and its applications *Lectures on Modern Convex Optimization* Aharon Ben-Tal, Arkadi Nemirovski, 2001-01-01 Here is a book devoted to well structured and thus efficiently solvable convex optimization problems with emphasis on conic quadratic and semidefinite programming The authors present the basic theory underlying these problems as well as their numerous applications in engineering including synthesis of filters Lyapunov stability analysis and structural design The authors also discuss the complexity issues and provide an overview of the basic theory of state of the art polynomial time interior point methods for linear conic quadratic and semidefinite programming The book's focus on well structured convex problems in conic form allows for unified theoretical and algorithmical treatment of a wide spectrum of important optimization problems arising in applications

Optimality Conditions in Convex Optimization Anulekha Dhara, Joydeep Dutta, 2011-10-17 Optimality Conditions in Convex Optimization explores an important and central issue in the field of convex optimization optimality conditions It brings together the most important and recent results in this area that have been scattered in the literature notably in the area of convex analysis essential in developing many of the important results in this book and not usually found in conventional texts Unlike other books on convex optimization which usually discuss algorithms along with some basic theory the sole focus of this book is on fundamental and advanced convex optimization theory Although many results presented in the book can also be proved in infinite dimensions the authors focus on finite dimensions to allow for much deeper results and a better understanding of the structures involved in a convex optimization problem They address semi infinite optimization problems approximate solution concepts of convex optimization problems and some classes of non convex problems which can be studied using the tools of convex analysis They include examples wherever needed provide details of major results and discuss proofs of the main results **Lectures on Convex Sets** Valeriu Soltan, 2020 The exposition is self contained detailed and provides multiple cross references that makes the book accessible to a large audience An essential part of the text is adapted from various research articles never presented before in a textbook format The book has a multidisciplinary nature it can be useful to specialists in geometry convex analysis operations research and optimization The new edition contains new chapters and additional exercises with respective solutions Despite the presence of a large number of monographs on convex sets there are quite a few textbooks on this topic This book is to the level of graduate study with higher degree of complexity and essentially more research related results and references
