Lesson 01: Recommended Development Environment

About PLCs

PLCs were developed to provide a means of controlling manufacturing processes through relays. For more information, see www.rockwellautomation.com.

A PLC is a computerized device that can be programmed to perform a variety of tasks. It can be used to control machinery, including control systems for pumps, motors, and solenoids. They accept a flow of data in the form of control signals, storing, analyzing and reacting to this information. They perform a series of operations on the data, and then output control signals to the machinery. They are used in a wide variety of applications, including manufacturing, material handling, and building automation.

Modern PLCs are often used in a variety of applications. They can be used for simple and intermediate control systems, as well as for more complex applications. They are often used in manufacturing environments.

The range of PLCs available is very large. However, the most common PLCs are the Allen-Bradley PLC-5 and the ControlLogix PLC-6. The PLC-5 is a modular PLC, and the ControlLogix PLC-6 is a monolithic PLC. The PLC-5 is used in a wide variety of applications, and the ControlLogix PLC-6 is used in more complex applications.

One of the most important aspects of PLC programming is the development of the control logic. This is done using a variety of programming languages, including ladder logic, relay logic, and structured text. The most common programming language is ladder logic, which is used to represent the control logic in a way that is easy to understand. Other programming languages include relay logic, which is used to represent the control logic in a way that is similar to a relay circuit, and structured text, which is used to represent the control logic in a way that is similar to a high-level programming language.

The PLC is often used in a variety of applications, including manufacturing, material handling, and building automation.

- **Building a PLC System**
 When you build a PLC system, you need to consider the PLC, the power supply, the I/O modules, and the rack. The PLC is the central component of the system, and it is used to execute the control logic. The power supply provides the power to the PLC and the I/O modules. The I/O modules are used to connect the PLC to the machinery. The rack is used to hold the PLC, the power supply, and the I/O modules.
- **Choosing a PLC System**
 When you choose a PLC system, you need to consider the size of the system, the number of I/O points, the speed of the PLC, and the cost. The size of the system is determined by the number of I/O points and the speed of the PLC. The number of I/O points is determined by the number of machinery that you need to control. The speed of the PLC is determined by the number of I/O points and the complexity of the control logic. The cost is determined by the size of the system, the number of I/O points, and the speed of the PLC.
