Computer Vision Richard Szeliski, 2010-09-30 Computer Vision Algorithms and Applications explores the variety of techniques commonly used to analyze and interpret images. It also describes challenging real world applications where vision is being successfully used both for specialized applications such as medical imaging and for fun consumer level tasks such as image editing and stitching which students can apply to their own personal photos and videos. More than just a source of recipes, this exceptionally authoritative and comprehensive textbook reference also takes a scientific approach to basic vision problems, formulating physical models of the imaging process before inverting them to produce descriptions of a scene. These problems are also analyzed using statistical models and solved using rigorous engineering techniques. Topics and features structured to support active curricula and project oriented courses with tips in the Introduction for using the book in a variety of customized courses. Presents exercises at the end of each chapter with a heavy emphasis on testing algorithms and containing numerous suggestions for small mid term projects. Provides additional material and more detailed mathematical topics in the Appendices which cover linear algebra, numerical techniques and Bayesian estimation theory. Suggests additional reading at the end of each chapter including the latest research in each sub field. In addition to a full Bibliography at the end of the book, supplies supplementary course material for students at the associated website <http://szeliski.org>. Book suitable for an upper level undergraduate or graduate level course in computer science or engineering. This textbook focuses on basic techniques that work under real world conditions and encourages students to push their creative boundaries. Its design and exposition also make it eminently suitable as a unique reference to the fundamental techniques and current research literature in computer vision. **Computer Vision** E. R. Machine Vision Architectures, Integration, and Applications Bruce G. Batchelor, Michael J. W. Chen, Frederick M. Waltz, 1992 **Towards Solving Computer Vision Problems** Iljung Samuel Kwak, 2019 The solution to a supervised computer vision problem consists of an application algorithm input data and a set of human generated labels Solving these kinds of tasks involves collecting large quantities of

data collecting appropriate labels and developing machine vision algorithms tailored to the application Progress on these problems has often benefited from large scale datasets with high fidelity labels Successful algorithms display a synergy between application goals and the size and quality of the dataset This thesis presents work highlighting the importance of each component of a supervised vision task First the problem of automatically classifying groups of people into social categories is introduced This problem is called Urban Tribe Classification To tackle this problem each individual and the entire group of individuals are modeled Since this was a newly introduced computer vision problem a dataset for this task was created On this dataset the combined representation of group and individuals outperforms using only the person representations This model showed promising results for automatic subculture classification Second the problem of creating perceptual embeddings based on human similarity judgements is tackled This work focuses on triplet similarity comparisons of the form Is object i more similar to j or k which have been useful for computer vision and machine learning applications Unfortunately triplet similarity comparisons like many human labeling efforts can be prohibitively expensive This work proposes two techniques for dealing with this obstacle First an alternative display for collecting triplets is designed This display shows a probe image and a grid of query images allowing the user to collect multiple triplets simultaneously The display is shown to reduce the cost and time of triplet collection In addition higher quality embeddings are created with the improved triplet collection UI A 10 000 food item dataset of human taste similarity was created using this UI Second SNaCK a low dimensional perceptual embedding algorithm that combines human expertise with automatic machine kernels is introduced Both parts are complementary human insight can capture relationships that are not apparent from the object s visual similarity and the machine can help relieve the human from having to exhaustively specify many constraints Finally the precise localization of key frames of an action is explored This work focuses on detecting the exact starting frame of a behavior an important task for neuroscience research To address this problem a loss designed to penalize extra and missed action start detections over small misalignments Recurrent neural networks RNN are trained to optimize this loss The model is shown to reduce the number of false positives an important criteria defined by the neuroscientist The performance of the model is evaluated on a new dataset the Mouse Reach Dataset a large annotated video dataset of mice performing a sequence of actions The dataset was created for neuroscience research On this dataset the proposed model outperforms related approaches and baseline methods using an unstructured loss
