

1. Draw a circuit diagram for a circuit which could be used to measure the resistance of an unknown component.

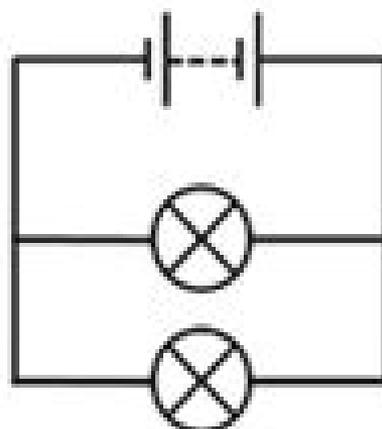

The variable resistor is used to vary the current through the component, so that a range of current and corresponding potential difference values can be measured.

2. Draw a circuit diagram showing a resistor and an LED connected in series with a cell.

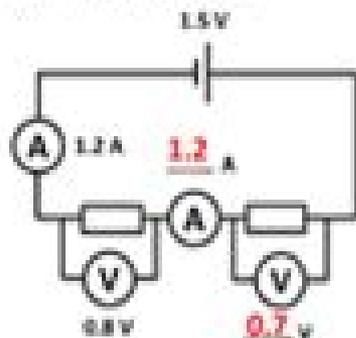

Direction of current flow (positive to negative) must be aligned with the arrow in the LED symbol. The side of the cell with the longer line is the positive terminal.

3. Draw a circuit diagram showing two bulbs connected in parallel with a battery.

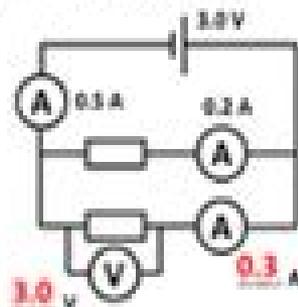

4. Write down the missing values from the voltmeter and ammeter in the circuit below.

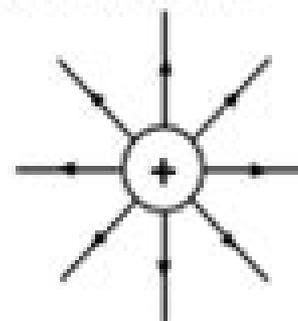

Series circuit:
Sum of potential differences = supply p.d.
Current stays the same around the circuit

5. Write down the missing values from the voltmeter and ammeter in the circuit below.

Parallel circuit:
Potential difference across each 'branch' is the same
Current before a junction = current after junction

6. Complete the diagram to show the electric field around a positively charged sphere.

Make sure that lines are evenly spaced, have arrows and are straight (drawn with a ruler).
