Chain Management Christian Ndubisi Madu, Chu-hua Kuei, 2005-06-10 Businesses today are faced with an avalanche of information There is a need to effectively manage information to serve customers better In today's highly competitive environment businesses need to be able to organize and coordinate their information so that a single view of information is maintained by all the service channels Information management can help to understand customers' wants and needs and integrate such in product design It helps to manage inventory and reduces both cost and the cycle time to introduce new products to the marketplace Time to market is a critical issue in achieving competitiveness and without the availability of timely and accurate information it will not be possible to respond proactively to the changing market environment This book is about ERP and Supply Chain Management ERP is the short form for Enterprise Resource Planning The aim of ERP is to integrate the functions of the different business units and departments such as finance operations accounting and human resources This integration is necessary to organize and coordinate information that may be scattered in different departments and making them available in an organized format to the different decision centers where they may be needed Through this integrative approach the different functional units of the business are able to share a common database exchange information and have a consistent view of their operations This consistent view is also presented to the customer thus improving the quality of customer service With the integration of the information system the different functional departments work together to achieve common organizational goals and objectives Without such integration common customer services such as order processing would be difficult to track and inconsistent information may be relayed by the different departments to the customer Supply chain management is an integral aspect of ERP Businesses today focus on their core competence It is no longer technically and economically feasible to focus on all activities Rather certain activities may be shifted to partners or vendors that have core competence in such areas Mercedes-Benz may find it better to subcontract its radios to Bose while focusing on its car designing Yet these two companies may need to share key information on

customers wants and needs as well as information on product designs Integrating a supplier into the common database helps in providing quality products and services that will satisfy the needs of the customer Information technology plays a critical role in effective development of ERP system As many businesses develop online marketplace it becomes even more important to develop a single view of transactions to all value chain partners including customers manufacturer suppliers and other vendors This book therefore adopts a focus on ERP and Supply Chain Management to develop better plans to better serve the customer It adopts a management and a systemic perspective of these issues and does not deal with the software aspects of ERP The focus is on the fundamentals rather than on the advanced issues The book is intended to help managers executives and students to understand the basic concepts of ERP and Supply Chain Management

Supply Chain Performance Measurement & E-Business Supply Chain Management: Including a Practical Excursus on the Intel Case Swen Beyer, 2010-07-07 Research Paper undergraduate from the year 2010 in the subject Business economics Supply Production Logistics grade 1 2 European School of Business Reutlingen Business Administration language English abstract The environmental surroundings of most companies have changed radically in recent years. Especially the competitive pressure has risen substantially over the past decades, fuelled by an increased globalization of markets and supply chains. In order to continuously satisfy consumer needs in a timely manner, organizations have to focus on performance and efficiency improvement measures. In terms of supply chain management, performance includes the three dimensions: efficiency, effectiveness, and flexibility, which have to be dealt with on an equal basis. One means to improve supply chain performance is the linkage between various IT applications involved in the whole supply chain. These efforts and trends are treated under the term electronic supply chain management (E-SCM). There are three major critical success factors for the successful operation of an electronic supply chain. These can be clustered into decision motivation (e.g. a shared vision and a strong motivation), implementation process (e.g. the tight integration of inter-organizational information systems and the re-engineering of inter-organizational business processes and infrastructure conditions (e.g. agreement upon a shared industry standard)). There are numerous benefits of an E-SCM implementation, such as increased communication speed and decreased cost in terms of communication, inventory, and customer service. Furthermore, E-SCM allows mitigating the bullwhip effect by improving the availability of information throughout the entire supply chain. In addition, E-SCM allows organizations to implement an entirely pull-based approach. One downside of E-SCM is the need to make a company's entire business processes transparent, also towards supply chain partners who might be engaged with competitors. A further danger of E-SCM is to over-rely on speed rather than on flexibility.

Evolution of Supply Chain Management Yoon Seok Chang, Harris C. Makatsoris, Howard D. Richards, 2007-05-08 In the last half of the twentieth century industry encountered a revolutionary change brought about by the harnessed power of seemingly ever increasing capacity speed and functionality of computers and microprocessors This strength provided management and workers within industries with new capabilities for management planning and control design quality assurance and customer support Organized information flow became the mainstay of industrial companies New tools and information technology systems emerged and evolved to enable companies to integrate the various departments Design Procurement Manufacturing Sales and Finance within companies particularly the larger ones including international corporations This was to give them a chance to meet new demands for product time to market just in time supply of orders and customer support To the smaller company these changes were not so apparent Neither the tools nor systems nor indeed their economic value seemed appropriate to them except for special cases While all this was happening the structure of the larger companies began to disintegrate Strong competitive pressures and globalization of the market place brought this about Shedding unwanted competence and subcontracting it to others became common practice Regional market pressures triggered companies to reorganize to create produce and distribute goods and services Greater dependency on chains of supply from external companies became the norm Medium and smaller sized companies began to gain some advantage and at the same time some were sucked into management and control systems governed by the larger companies
