Integrated CMOS Circuits for Optical Communications Mark Ingels, Michiel Steyaert, 2013-03-09 This work investigates the feasibility of the integration of interface circuits for optical communication systems in a standard unmodified digital CMOS process This paves the way for single chip communication systems where the optical interfaces are integrated on the same die as the required digital circuitry The optical receiver is a key element in the optical communication link In this work a transimpedance amplifier which consists of a voltage amplifier with resistive feedback is used as the first stage Unlike for many other circuits the optimal place of its dominant pole is the input node It is also demonstrated that a high gain of the voltage amplifier is primordial to obtain good performances and that this may be obtained through the use of multiple stages Noise aspects are investigated and the conclusion is drawn that the amplifier s input capacitance can be smaller than the photodiode s capacitance for optimal performance

System-level Test and Validation of Hardware/Software Systems Matteo Sonza Reorda, Zebo Peng, Massimo Violante, 2006-03-30 New manufacturing technologies have made possible the integration of entire systems on a single chip This new design paradigm termed system on chip SOC together with its associated manufacturing problems represents a real challenge for designers SOC is also reshaping approaches to test and validation activities These are beginning to migrate from the traditional register transfer or gate levels of abstraction to the system level Until now test and validation have not been supported by system level design tools so designers have lacked the infrastructure to exploit all the benefits stemming from the adoption of the system level of abstraction Research efforts are already addressing this issue This monograph provides a state of the art overview of the current validation and test techniques by covering all aspects of the subject including modeling of bugs and defects stimulus generation for validation and test purposes including timing errors design for testability
