21st century This book proves it can and shows exactly how For over a century the calculation problem has been capitalism's knockout argument against socialism without market prices how could any economy coordinate millions of products billions of preferences and complex supply chains Even well intentioned socialist planning would collapse into chaos and shortage But that argument was based on 20th century technology Everything has changed Red Algorithms demonstrates how modern computing power real time data machine learning and digital democracy platforms make democratic economic planning not only possible but practical in ways that seemed like fantasy fifty years ago The technological barriers that made central planning impossible have been demolished The calculation problem is solvable What You'll Discover Why the calculation problem seemed insurmountable and what Mises and Hayek actually argued that made their critique so convincing What the Soviet experience really proved about planning's possibilities and failures How exponential growth in computing power has fundamentally transformed what's possible for economic coordination Why markets fail catastrophically at exactly the problems they claim to solve from climate change to inequality How democratic planning would actually work in practice from housing and healthcare to innovation and environmental sustainability The real risks and challenges surveillance technocracy transition obstacles and how to address them What we're really trying to achieve not just efficiency but human flourishing democratic control and ecological sustainability This Book Is For You If You believe capitalism is failing but wonder if alternatives are possible You're intrigued by socialism but skeptical about whether planning can work You work in tech and want to use your skills for something better than surveillance capitalism You're tired of being told there is no alternative when you know something's deeply wrong You want rigorous analysis not just slogans this book takes the strongest arguments against planning seriously and responds with evidence and analysis What Makes This Different Unlike utopian manifestos or abstract theory Red Algorithms provides concrete technically informed analysis of how democratic planning could coordinate housing construction healthcare delivery food systems renewable energy transitions and innovation all while maintaining genuine democracy and addressing climate change This isn't nostalgia for Soviet style planning This is a 21st century vision that learns from historical failures embraces modern technology and insists that democracy is non negotiable The tools exist The question is whether we have the political will to use them The Choice Ahead Artificial intelligence and algorithmic coordination are being developed right now The question isn't whether we'll use these tools it's who will control them and what they'll serve Under capitalism AI means surveillance displacement and concentrated power Under democratic socialism it could mean coordination for human needs reduced work time and genuine freedom The calculation problem that haunted socialism for a century has been solved Now we need to build the alternative *Artificial Intelligence & Collusion* Ariel Ezrachi, Maurice E. Stucke, 2019 The development of self learning and independent computers has long captured our imagination The HAL 9000 computer in the 1968 film 2001 A Space Odyssey for example assured I am putting myself to the fullest possible use which is all I think that any conscious entity can ever hope to do Machine learning

raises many challenging legal and ethical questions as to the relationship between man and machine humans control or lack of it over machines and accountability for machine activities While these issues have long captivated our interest few would envision the day when these developments and the legal and ethical challenges raised by them would become an antitrust issue Sophisticated computers are central to the competitiveness of present and future markets With the accelerating development of AI they are set to change the competitive landscape and the nature of competitive restraints As pricing mechanisms shift to computer pricing algorithms so too will the types of collusion We are shifting from the world where executives expressly collude in smoke filled hotel rooms to a world where pricing algorithms continually monitor and adjust to each other s prices and market data Our paper addresses these developments and considers the application of competition law to an advanced computerised trade environment After discussing the way in which computerised technology is changing the competitive landscape we explore four scenarios where AI can foster anticompetitive collusion and the legal and ethical challenges each scenario raises
