VS

EDGE

computing

LOCATION

REMOTE - Storage, management and processing occurs on a remote central network server. The data is accessible over the internet, away from the source.

NEAR-ACCESS - Data is processed physically close to or on the actual device, the data source, which is located at the edge of the network.

LATENCY

HIGH - Frequent and high load data exchange puts strain on the network, resulting in high latency.

LOW - Requires little bandwidth as information is initially processed close to the data source.

CAPACITY

HIGH - Can process large volumes of data and scale accordingly; cost is also determined by processing unit used.

LOW - Can only process so much data due to limited availability of resources. This is somewhat compensated by near-access communication with nodes.

DISTRIBUTION

CENTRALIZED - The cloud is a Centrally Managed System (CMS), which means it is controlled by a single entity.

DECENTRALIZED - Computations are performed at the edge of the network, often utilizing distributed nodes.

SECURITY

HIGH - The virtual server is managed by one entity, which ensures maximum protection

MEDIUM - Distributed data means security can be more susceptible to individual threats and unaccounted outside factors.

BENEFITS

- Cost reduction
- Scalability
- Accessibility
- Security

- High speed and responsiveness
- Low latency
- Real-time results
- Edge analytics

USE CASES

Inventory, BI and Big Data storage, deep analysis, rich data visualisation, dashboards, reports, back-end access

IoT (handheld devices, wearables) and IIoT (factory floor robots, digital signage at retail stores) devices, MRIs, traffic lights, autonomous vehicles, ATMs - mission critical use cases in general.
