**Linear and Nonlinear Programming** David G. Luenberger,Yinyu Ye,2021-10-31 The 5th edition of this classic textbook covers the central concepts of practical optimization techniques with an emphasis on methods that are both state of the art and popular One major insight is the connection between the purely analytical character of an optimization problem and the behavior of algorithms used to solve that problem End of chapter exercises are provided for all chapters The material is organized into three separate parts Part I offers a self contained introduction to linear programming The presentation in this part is fairly conventional covering the main elements of the underlying theory of linear programming many of the most effective numerical algorithms and many of its important special applications Part II which is independent of Part I covers the theory of unconstrained optimization including both derivations of the appropriate optimality conditions and an introduction to basic algorithms This part of the book explores the general properties of algorithms and defines various notions of convergence In turn Part III extends the concepts developed in the second part to constrained optimization problems Except for a few isolated sections this part is also independent of Part I As such Parts II and III can easily be used without reading Part I and in fact the book has been used in this way at many universities New to this edition are popular topics in data science and machine learning such as the Markov Decision Process Farkas lemma

Optimization is the process of finding the best alternate solution among a given set of solutions under some given constraints The process of finding the maximum or minimum possible value which a function can attain in its domain is known as optimization One of the most striking trends that emerged in the optimization field is the simulation of natural processes as efficient global search methods The natural processes or phenomena are firstly analyzed mathematically and then coded as computer programs for solving complex nonlinear real world problems The resulting methods are called Nature Inspired Algorithms that can often outperform classic methods The advantages of these methods are their ability to solve various standard or application based problems successfully without any prior knowledge of the problem space Moreover these algorithms are more likely to obtain the global optima of a given problem They do not require any continuity and differentiability of the objective functions Also they work on a randomly generated population of solutions instead of one solution They are easy to program and can be easily implemented on a computer Some of the examples of Nature Inspired
