Mathematical Modeling in Economics and

Finance: Probability, Stochastic Processes, and Differential Equations Steven R. Dunbar, 2019-04-03 Mathematical Modeling in Economics and Finance is designed as a textbook for an upper division course on modeling in the economic sciences The emphasis throughout is on the modeling process including post modeling analysis and criticism It is a textbook on modeling that happens to focus on financial instruments for the management of economic risk The book combines a study of mathematical modeling with exposure to the tools of probability theory difference and differential equations numerical simulation data analysis and mathematical analysis Students taking a course from Mathematical Modeling in Economics and Finance will come to understand some basic stochastic processes and the solutions to stochastic differential equations They will understand how to use those tools to model the management of financial risk They will gain a deep appreciation for the modeling process and learn methods of testing and evaluation driven by data The reader of this book will be successfully positioned for an entry level position in the financial services industry or for beginning graduate study in finance economics or actuarial science The exposition in Mathematical Modeling in Economics and Finance is crystal clear and very student friendly The many exercises are extremely well designed Steven Dunbar is Professor Emeritus of Mathematics at the University of Nebraska and he has won both university wide and MAA prizes for extraordinary teaching Dunbar served as Director of the MAA s American Mathematics Competitions from 2004 until 2015 His ability to communicate mathematics is on full display in this approachable innovative text

[Advances In Statistical Inference For Processes Driven By Fractional Processes: Inference For Fractional Processes](#) B L S Prakasa Rao, 2025-07-08 One of the important problems in studying stochastic phenomena is to develop stochastic models and understand their implications behind the phenomenon Long range dependence is an important stochastic phenomena and it needs study of special type of stochastic processes for modelling My earlier book on Statistical Inference for Fractional Diffusion Processes 2010 dealt with several aspects for modelling by fractional Brownian motion This book will contain my work on parametric and nonparametric inference for processes driven by fractional processes such as fractional Brownian motion mixed fractional Brownian motion sub fractional Brownian motion alpha stable noise fractional Levy process and Gaussian processes

An Introduction to Computational Risk Management of Equity-Linked Insurance Runhuan Feng, 2018-06-13 The quantitative modeling of complex systems of interacting risks is a fairly recent development in the financial and insurance industries Over the past decades there has been tremendous innovation and development in the actuarial field In addition to undertaking mortality and longevity risks in traditional life and annuity products insurers face unprecedented financial risks since the introduction of equity linking insurance in 1960s As the industry moves into the new territory of managing many intertwined financial and insurance risks non traditional problems and challenges arise presenting great opportunities for technology development Today s computational power and technology make it possible for the life insurance industry to develop highly sophisticated models which were impossible just a decade ago Nonetheless as

more industrial practices and regulations move towards dependence on stochastic models the demand for computational power continues to grow While the industry continues to rely heavily on hardware innovations trying to make brute force methods faster and more palatable we are approaching a crossroads about how to proceed An Introduction to Computational Risk Management of Equity Linked Insurance provides a resource for students and entry level professionals to understand the fundamentals of industrial modeling practice but also to give a glimpse of software methodologies for modeling and computational efficiency Features Provides a comprehensive and self contained introduction to quantitative risk management of equity linked insurance with exercises and programming samples Includes a collection of mathematical formulations of risk management problems presenting opportunities and challenges to applied mathematicians Summarizes state of arts computational techniques for risk management professionals Bridges the gap between the latest developments in finance and actuarial literature and the practice of risk management for investment combined life insurance Gives a comprehensive review of both Monte Carlo simulation methods and non simulation numerical methods Runhuan Feng is an Associate Professor of Mathematics and the Director of Actuarial Science at the University of Illinois at Urbana Champaign He is a Fellow of the Society of Actuaries and a Chartered Enterprise Risk Analyst He is a Helen Corley Petit Professorial Scholar and the State Farm Companies Foundation Scholar in Actuarial Science Runhuan received a Ph D degree in Actuarial Science from the University of Waterloo Canada Prior to joining Illinois he held a tenure track position at the University of Wisconsin Milwaukee where he was named a Research Fellow Runhuan received numerous grants and research contracts from the Actuarial Foundation and the Society of Actuaries in the past He has published a series of papers on top tier actuarial and applied probability journals on stochastic analytic approaches in risk theory and quantitative risk management of equity linked insurance Over the recent years he has dedicated his efforts to developing computational methods for managing market innovations in areas of investment combined insurance and retirement planning

Mathematical Reviews, 2003 Volatility Surface and Term Structure Kin Keung Lai, Jerome Yen, Shifei Zhou, Hao Wang, 2013-09-11 This book provides different financial models based on options to predict underlying asset price and design the risk hedging strategies Authors of the book have made theoretical innovation to these models to enable the models to be applicable to real market The book also introduces risk management and hedging strategies based on different criterions These strategies provide practical guide for real option trading This book studies the classical stochastic volatility and deterministic volatility models For the former the classical Heston model is integrated with volatility term structure The correlation of Heston model is considered to be variable For the latter the local volatility model is improved from experience of financial practice The improved local volatility surface is then used for price forecasting VaR and CVaR are employed as standard criterions for risk management The options trading strategies are also designed combining different types of options and they have been proven to be profitable in real market This book is a combination of theory and practice Users will find the applications of

these financial models in real market to be effective and efficient **AMSTAT News** American Statistical Association,2003
