

## Electric Circuits

2. Consider the two requirements for an electric circuit (described in question #1). When a light bulb is burned out and no longer works, requirement # \_\_\_\_\_ is not met. When a battery no longer works, requirement # \_\_\_\_\_ is not met.
3. What do you believe? Respond to the following statements as being **TRUE** or **FALSE**.
- When a battery no longer works, it is out of charge and must be re-charged before it can be used again. **T or F**
  - A battery can be a source of charge in a circuit. The charge which flows through the circuit originates in the battery. **T or F**
  - Charge becomes used up as it flows through a circuit. The amount of charge which exits a light bulb is less than the amount which enters the light bulb. **T or F**
  - Charge flows through circuits at very high speeds. This explains why the light bulb turns on immediately after the wall switch is flipped. **T or F**
  - Commonwealth Edison supplies millions and millions of electrons to our homes everyday. **T or F**

4. A current is said to exist whenever \_\_\_\_\_
- a wire is charged
  - a battery is present
  - electric charges are unbalanced
  - electric charges move in a loop
5. As a quantity, electric current is defined as the \_\_\_\_\_
- amount of charge present in a circuit
  - potential energy per charge
  - rate at which charge moves through a cross-sectional area of a wire
  - speed at which charge moves from one location to another location

6. Complete the statements:

- A current of one ampere is a flow of charge at the rate of \_\_\_\_\_ coulomb per second.
- When a charge of 8 C flows past any point along a circuit in 2 seconds, the current is \_\_\_\_\_ A.
- If 5 C of charge flow past point A (diagram at right) in 10 seconds, then the current is \_\_\_\_\_ A.
- If the current at point D is 2.0 A, then \_\_\_\_\_ C of charge flow past point D in 10 seconds.
- If 12 C of charge flow past point A in 3 seconds, then 8 C of charge will flow past point E in \_\_\_\_\_ seconds.

- f. **TRUE or FALSE:**

The current at point E is considerably less than the current at point A since charge is being used up in the light bulbs.

7. Which sentence best describes what happens to charge as it moves through an electric circuit?
- Charge is consumed or used up.
  - Charge is re-energized and recycled.
8. Which sentence best describes how fast charge moves through an electric circuit?
- Charge moves very fast; faster than any human can run.
  - Charge moves very slow; slower than the proverbial snail.
9. When you turn on the room lights, they light immediately. This is best explained by the fact that \_\_\_\_\_
- electrons move very fast from the switch to the light bulb filament.
  - electrons present everywhere in the circuit move instantly.
