

- *Exercise 2.2-4 from CLRS.* How can we modify almost any algorithm to have a good best-case running time?

- *Problem 4.1-6 from CLRS.*

Solve the recurrence $T(n) = 2T(\sqrt{n}) + 1$ by making a change of variables. Your solution should be asymptotically tight. Do not worry about whether values are integral.

- *Solve problem 2.4 from DVP*

Suppose you are choosing between the following three algorithms.

1

-
- **Algorithm A** solves problems by dividing them into five sub-problems of half the size, recursively solving each sub-problem, and then combining the solutions in linear time.
 - **Algorithm B** solves problems of size n by recursively solving two sub-problems of size $n - 1$ and then combining the solutions in constant time.
 - **Algorithm C** solves problems of size n by dividing them into nine sub-problems of size $n/3$, recursively solving each sub-problem, and then combining the solutions in $\mathcal{O}(n^2)$ time.

What are the running times of each of these algorithms (in big-O notation), and which would you choose.

Introduction to Algorithms, third edition Thomas H. Cormen, Charles E. Leiserson, Ronald L. Rivest, Clifford Stein, 2009-07-31 The latest edition of the essential text and professional reference with substantial new material on such topics as vEB trees multithreaded algorithms dynamic programming and edge based flow Some books on algorithms are rigorous but incomplete others cover masses of material but lack rigor Introduction to Algorithms uniquely combines rigor and comprehensiveness The book covers a broad range of algorithms in depth yet makes their design and analysis accessible to all levels of readers Each chapter is relatively self contained and can be used as a unit of study The algorithms are described in English and in a pseudocode designed to be readable by anyone who has done a little programming The explanations have been kept elementary without sacrificing depth of coverage or mathematical rigor

The first edition became a widely used text in universities worldwide as well as the standard reference for professionals. The second edition featured new chapters on the role of algorithms, probabilistic analysis, and randomized algorithms and linear programming. The third edition has been revised and updated throughout. It includes two completely new chapters on van Emde Boas trees and multithreaded algorithms, substantial additions to the chapter on recurrence now called Divide and Conquer, and an appendix on matrices. It features improved treatment of dynamic programming and greedy algorithms and a new notion of edge based flow in the material on flow networks. Many exercises and problems have been added for this edition. The international paperback edition is no longer available; the hardcover is available worldwide.

How to Think about Algorithms Jeff Edmonds, 2024-03-07. Understand algorithms and their design with this revised student friendly textbook. Unlike other algorithms books, this one is approachable; the methods it explains are straightforward, and the insights it provides are numerous and valuable. Without grinding through lots of formal proof, students will benefit from step by step methods for developing algorithms, expert guidance on common pitfalls, and an appreciation of the bigger picture. Revised and updated, this second edition includes a new chapter on machine learning algorithms and concise key concept summaries at the end of each part for quick reference. Also new to this edition are more than 150 new exercises; selected solutions are included to let students check their progress, while a full solutions manual is available online for instructors. No other text explains complex topics such as loop invariants as clearly, helping students to think abstractly and preparing them for creating their own innovative ways to solve problems.

Algorithmics for Hard Problems Juraj Hromkovič,2013-03-14 Algorithmic design especially for hard problems is more essential for success in solving them than any standard improvement of current computer technologies Because of this the design of algorithms for solving hard problems is the core of current algorithmic research from the theoretical point of view as well as from the practical point of view There are many general textbooks on algorithmics and several specialized books devoted to particular approaches such as local search randomization approximation algorithms or heuristics But there is no textbook that focuses on the design of algorithms for hard computing tasks and that systematically explains combines and compares the main possibilities for attacking hard algorithmic problems As this topic is fundamental for computer science this book tries to elose this gap Another motivation and probably the main reason for writing this book is connected to education The considered area has developed very dynamically in recent years and the research on this topic discovered several profound re sults new concepts and new methods Some of the achieved contributions are so fundamental that one can speak about paradigms which should be included in the education of every computer science student Unfortunately this is very far from reality This is because these paradigms are not sufficiently known in the computer science community and so they are insufficiently communicated to students and practitioners
