Modeling, Analysis and Control of Hydraulic Actuator for Forging Xinjiang Lu, Minghui Huang, 2017-12-30 This book describes load modeling approaches for complex work pieces and batch forgings and demonstrates analytical modeling and data driven modeling approaches for known and unknown complex forging processes It overcomes the current shortcomings of modeling analysis and control approaches presenting contributions in three major areas In the first several novel modeling approaches are proposed a process shape decomposition modeling method to help estimate the deformation force an online probabilistic learning machine for the modeling of batch forging processes and several data driven identification and modeling approaches for unknown forging processes under different work conditions The second area develops model based dynamic analysis methods to derive the conditions of stability and creep Lastly several novel intelligent control methods are proposed for complex forging processes One of the most serious problems in forging forming involves the inaccurate forging conditions velocity and position offered by the hydraulic actuator due to the complexity of both the deformation process of the metal work piece and the motion process of the hydraulic actuator The book summarizes the current weaknesses of modeling analysis and control approaches

are summarized as follows a With the current modeling approaches it is difficult to model complex forging processes with unknown parameters as they only model the dynamics in local working areas but do not effectively model unknown nonlinear systems across multiple working areas further they do not take the batch forging process into account let alone its distribution modeling b All previous dynamic analysis studies simplify the forging system to having a single frequency pressure fluctuation and neglect the influences of non linear load force Further they fail to take the flow equation in both valves and cylinders into account c Conventional control approaches only consider the linear deformation force and pay no attention to sudden changes and the motion synchronization for the multi cylinder system making them less effective for complex nonlinear time varying forging processes subject to sudden changes
