

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Pressure gaskets are generally used to seal and support the flange, the combination of both ends is a flange to allow installation. These consist of 2 gaskets which distribute load (flange is a pressure vessel application as all flanges are high temperature used to increase the quality). A gasket is used to maintain the pressure in a system and to allow it to be used throughout the life cycle application. The gasket compresses the two components between the mating surfaces of the vessel. This is done by creating a radial force on the flange, the gasket is used to seal the components between the mating surfaces. If the gasket is not installed correctly for pressure and temperature through the life of the application then it will be replaced by a gasket.

In order to determine the application requirements will require the gasket design to determine the gasket to be used. Every gasket application is unique but there are common elements that must be addressed to ensure the performance of the gasket in an application.
