Computational Methods for Fluid Dynamics Joel H. Ferziger, Milovan Perić, Robert L. Street, 2019-08-16 This book is a guide to numerical methods for solving fluid dynamics problems The most widely used discretization and solution methods which are also found in most commercial

CFD programs are described in detail. Some advanced topics like moving grids simulation of turbulence computation of free surface flows multigrid methods and parallel computing are also covered. Since CFD is a very broad field we provide fundamental methods and ideas with some illustrative examples upon which more advanced techniques are built. Numerical accuracy and estimation of errors are important aspects and are discussed in many examples. Computer codes that include many of the methods described in the book can be obtained online. This 4th edition includes major revision of all chapters, some new methods are described and references to more recent publications with new approaches are included. Former Chapter 7 on solution of the Navier Stokes equations has been split into two Chapters to allow for a more detailed description of several variants of the Fractional Step Method and a comparison with SIMPLE like approaches. In Chapters 7 to 13 most examples have been replaced or recomputed and hints regarding practical applications are made. Several new sections have been added to cover e.g. immersed boundary methods, overset grids, methods fluid structure interaction and conjugate heat transfer.

Guide to Process Based Modeling of Lakes and Coastal Seas Anders Omstedt, 2011-05-18. Mounting concern about the influence of humans on climate and environmental conditions has increased the need for multi disciplinary modeling efforts including systems such as oceans, coastal seas, lakes, land surfaces, ice, rivers and atmosphere. This unique book will stimulate students and researchers to develop their modeling skills and make model codes and data transparent to other research groups. The book uses the general equation solver PROBE to introduce process oriented numerical modeling and to build understanding of the subject step by step. PROBE is a general equation solver for one dimensional transient or two dimensional steady boundary layers. By the construction of nets of sub basins the book illustrates how the process based modeling can be extended complementing three dimensional modeling. The equation solver has been used in many applications particularly in Sweden and Finland with their numerous lakes, archipelago, seas, fjords and coastal zones. It has also been used for process studies in the Arctic and in the Mediterranean Sea and the approach is general for applications in many other environmental applications. more on <http://springer.com> 978 3 642 17727 9
