Your 60-year-old patient has type 2 diabetes, which has been moderately well controlled by diet and oral medication until now. However, recently the patient's blood sugars have been high. The doctor has decided to commence insulin injections. You are seeing the patient to show him/her how to administer injections.

TASK

- Confirm reason for appointment (self-administering injections for diabetes: advice, observation). Find out how patient feels about insulin injections.
- Explore reasons for patient's anxiety (injecting process, fear of pain/needles, etc.).
- Reassure patient about managing injections (e.g., clear instructions, easier with practice, etc.). Stress importance of insulin injections (e.g., faster absorption into bloodstream: not broken down in stomach, more effective, etc.).
- Emphasise injections are best option available (e.g., current management: not working, etc.). Explain injection-giving process (e.g., washing and drying hands, pinching skin, insertion of needle: 45–90 degree angle, leaving in place 5–10 seconds, etc.). Describe need to rotate injection site (e.g., preventing formation of lumps, risk of less insulin absorption, etc.).
- Explain importance of safe needle disposal (e.g., suitable containers, proper care and handling, etc.). Outline insulin storage (e.g., refrigerating unopened insulin, not exposing to sunlight/high temperatures, checking expiration dates, etc.). Establish patient's willingness to be observed self-injecting.
